

# **Monitor with a Queue and Semaphores**

# Monitor

Full –  
0 when full

3

0

Empty –  
0 when empty

Producer

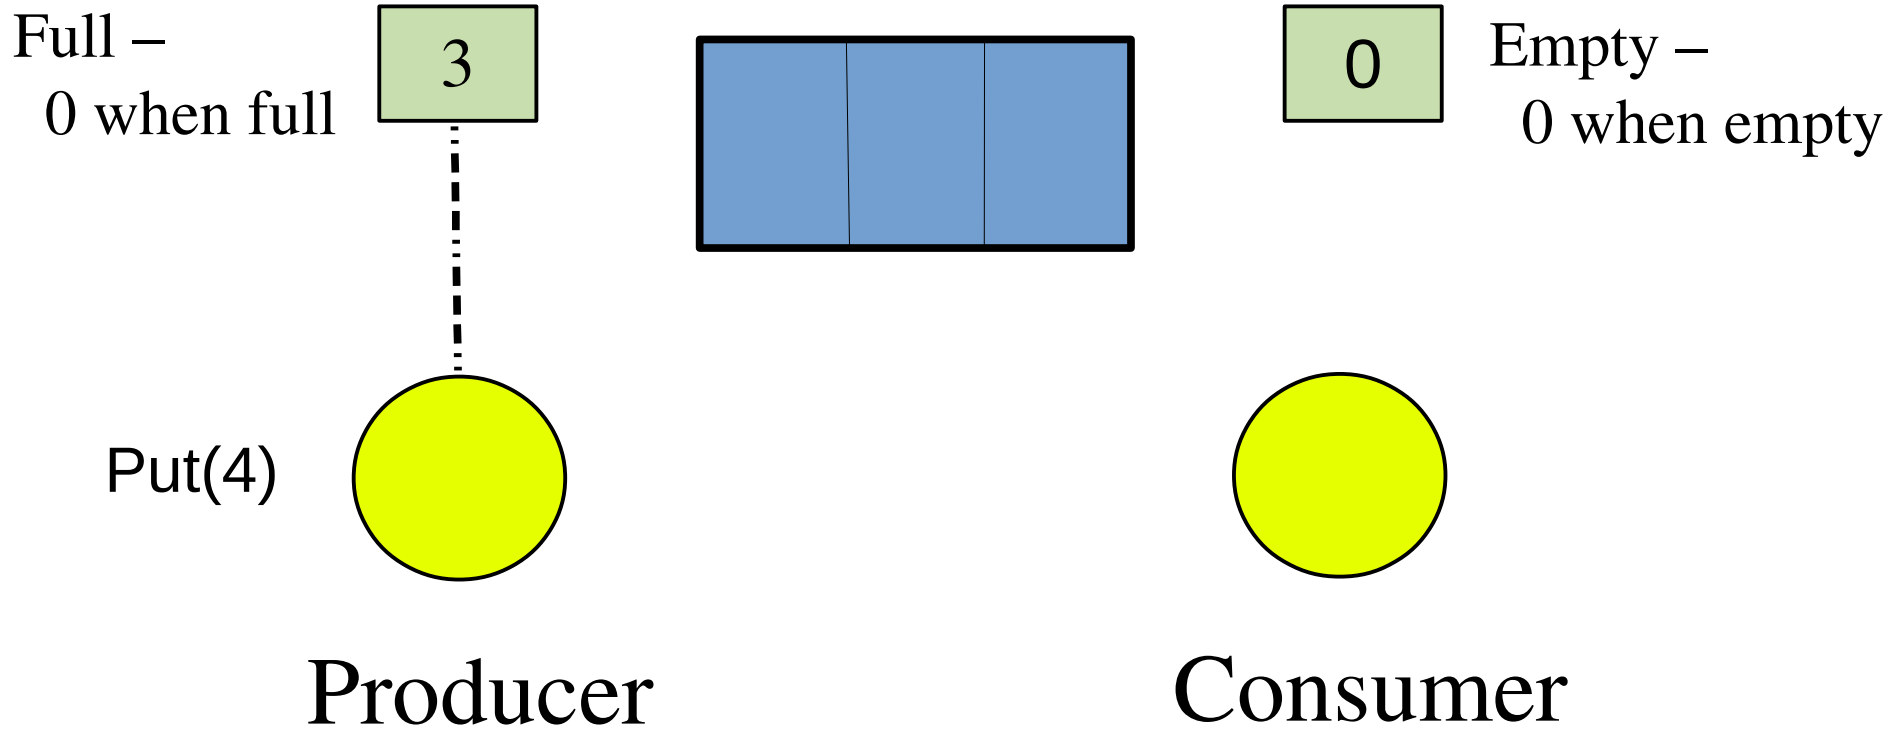

Consumer

Monitor uses a buffer capable of holding three tokens

Count of Full semaphore goes to 0 when the buffer is full

Count of Empty semaphore goes to 0 when the buffer is empty

# Monitor

Monitor buffer is empty

The Full semaphore's count is checked to be  $> 0$

# Monitor

Monitor buffer is empty

The Full semaphore's count is checked to be  $> 0$

It is! So producer passes through and decrements Full's count

# Monitor

Full –  
0 when full

2

0

Empty –  
0 when empty

Put(4)

Producer

Consumer

Monitor now has two vacant slots, one slot contains 4  
Producer sends a 4 into the Monitor's buffer

# Monitor

Full –  
0 when full

2

1

Empty –  
0 when empty

Put(4)

Producer

Consumer

Monitor now has two vacant slots, one slot contains 4  
Producer increments the Empty semaphore's count

# Monitor

Full –  
0 when full

2

1

Empty –  
0 when empty

Put(4)

Producer

Consumer

Monitor now has two vacant slots, one slot contains 4  
Producer returns and continues processing

# Monitor

Full –  
0 when full

2

1

Empty –  
0 when empty

Producer

Consumer

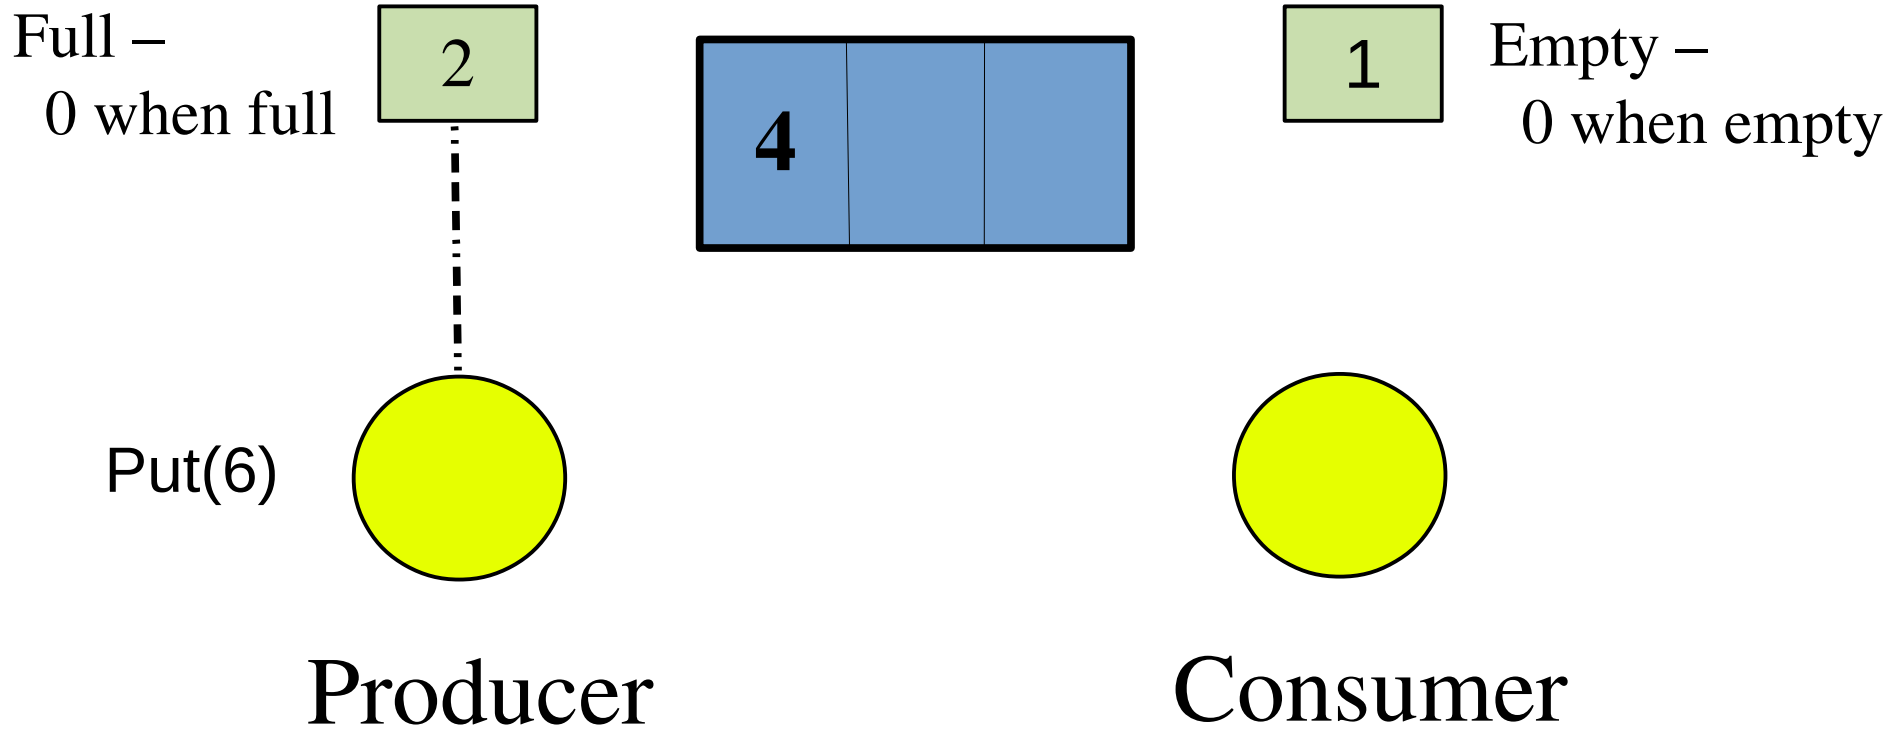

Monitor now has two vacant slots, one slot contains 4

The Full semaphore's count is 2

The Empty semaphore's count is 1

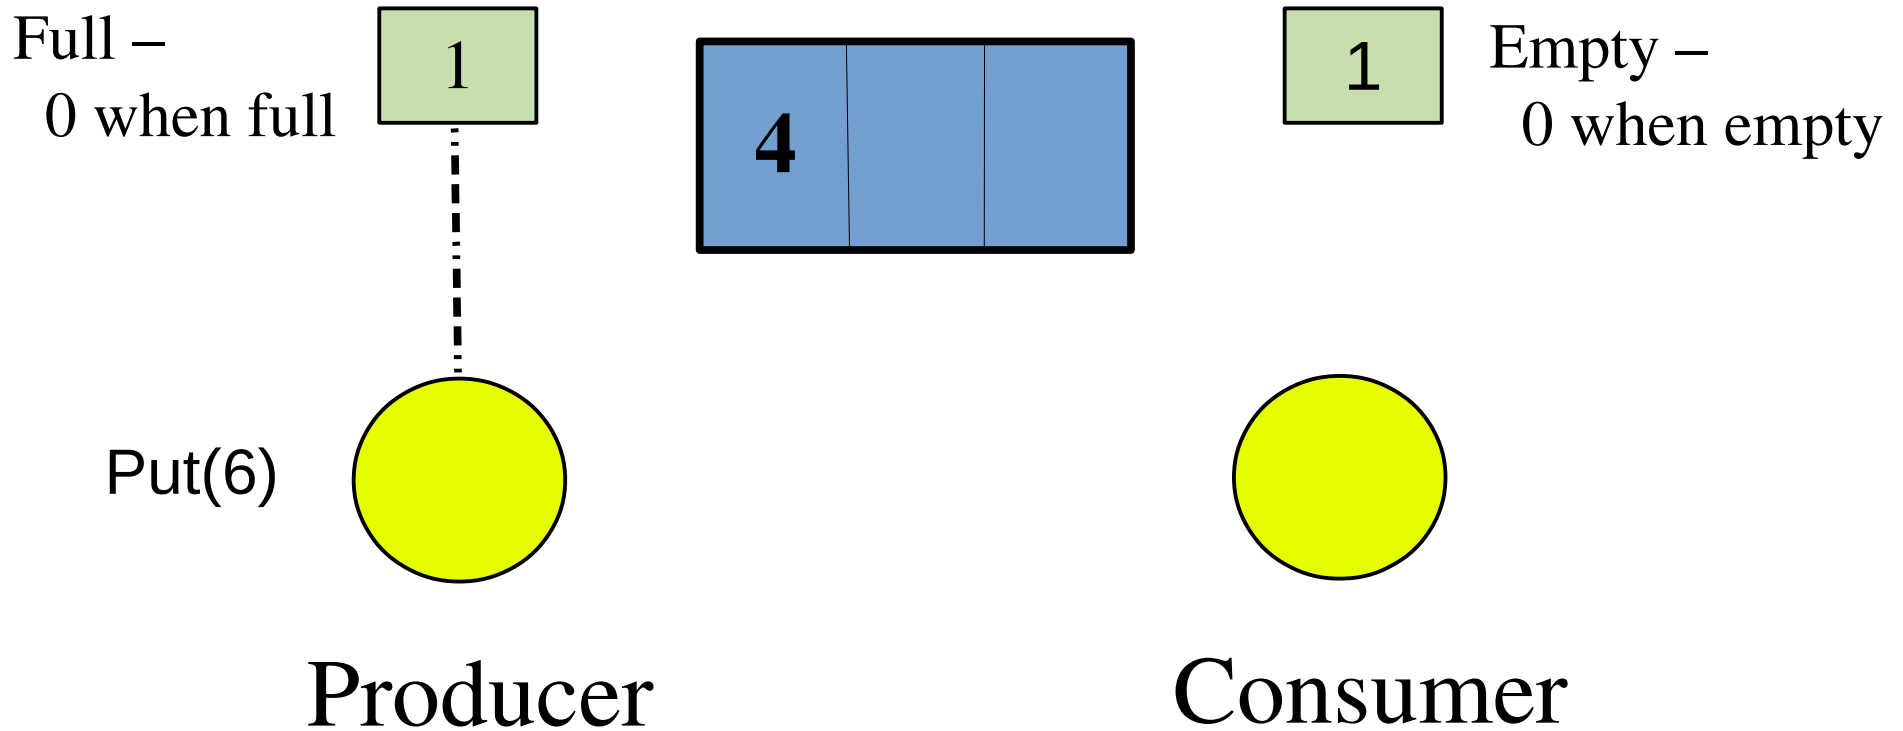

# Monitor

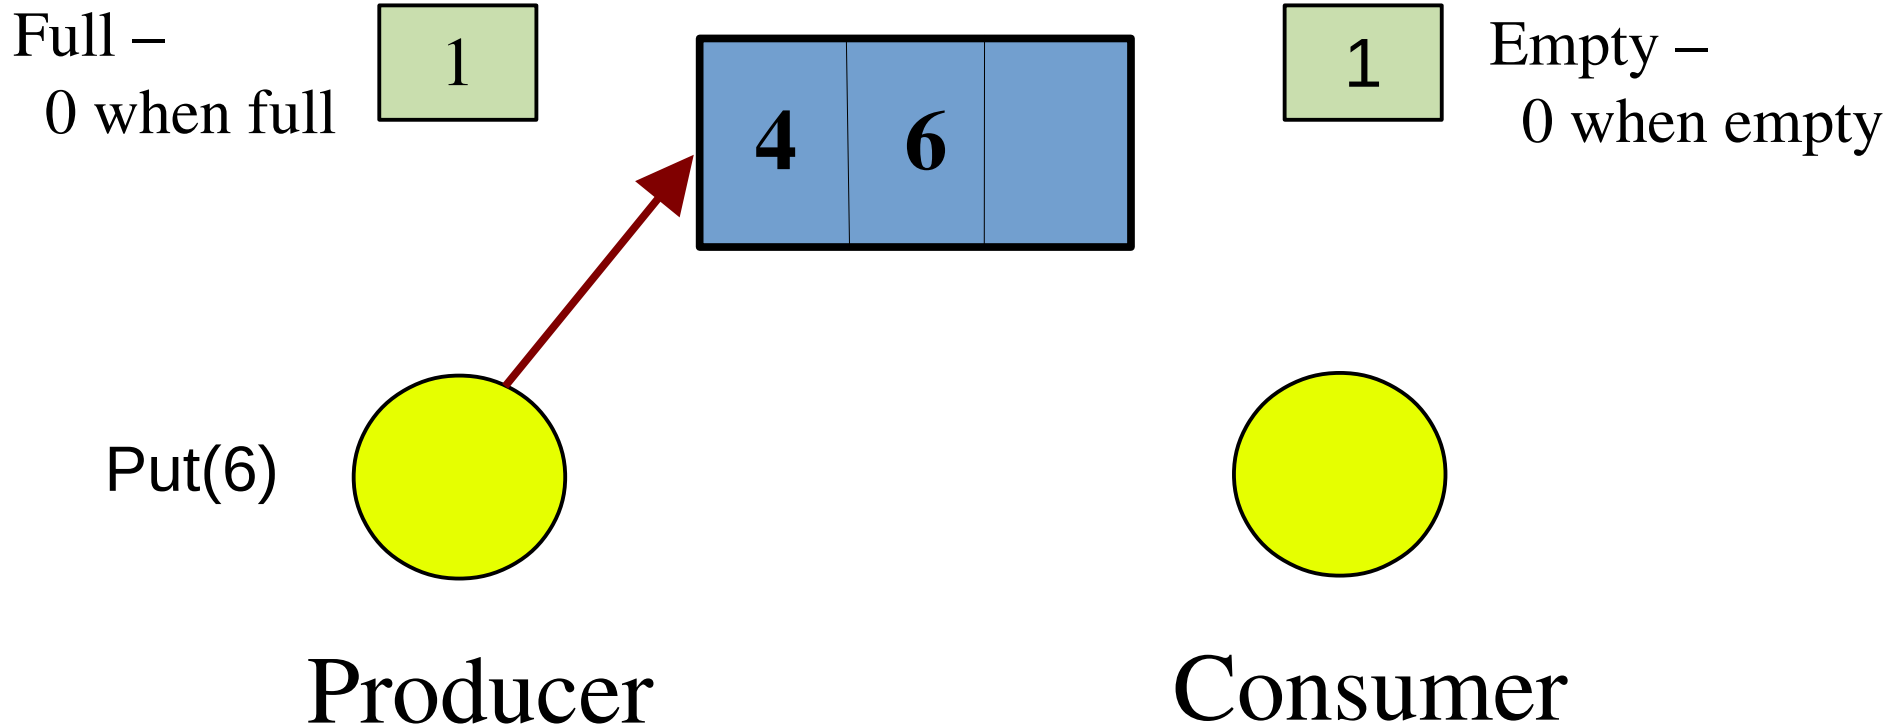

Monitor now has two vacant slots, one slot contains 4  
The Full semaphore's count is checked to be  $> 0$

# Monitor

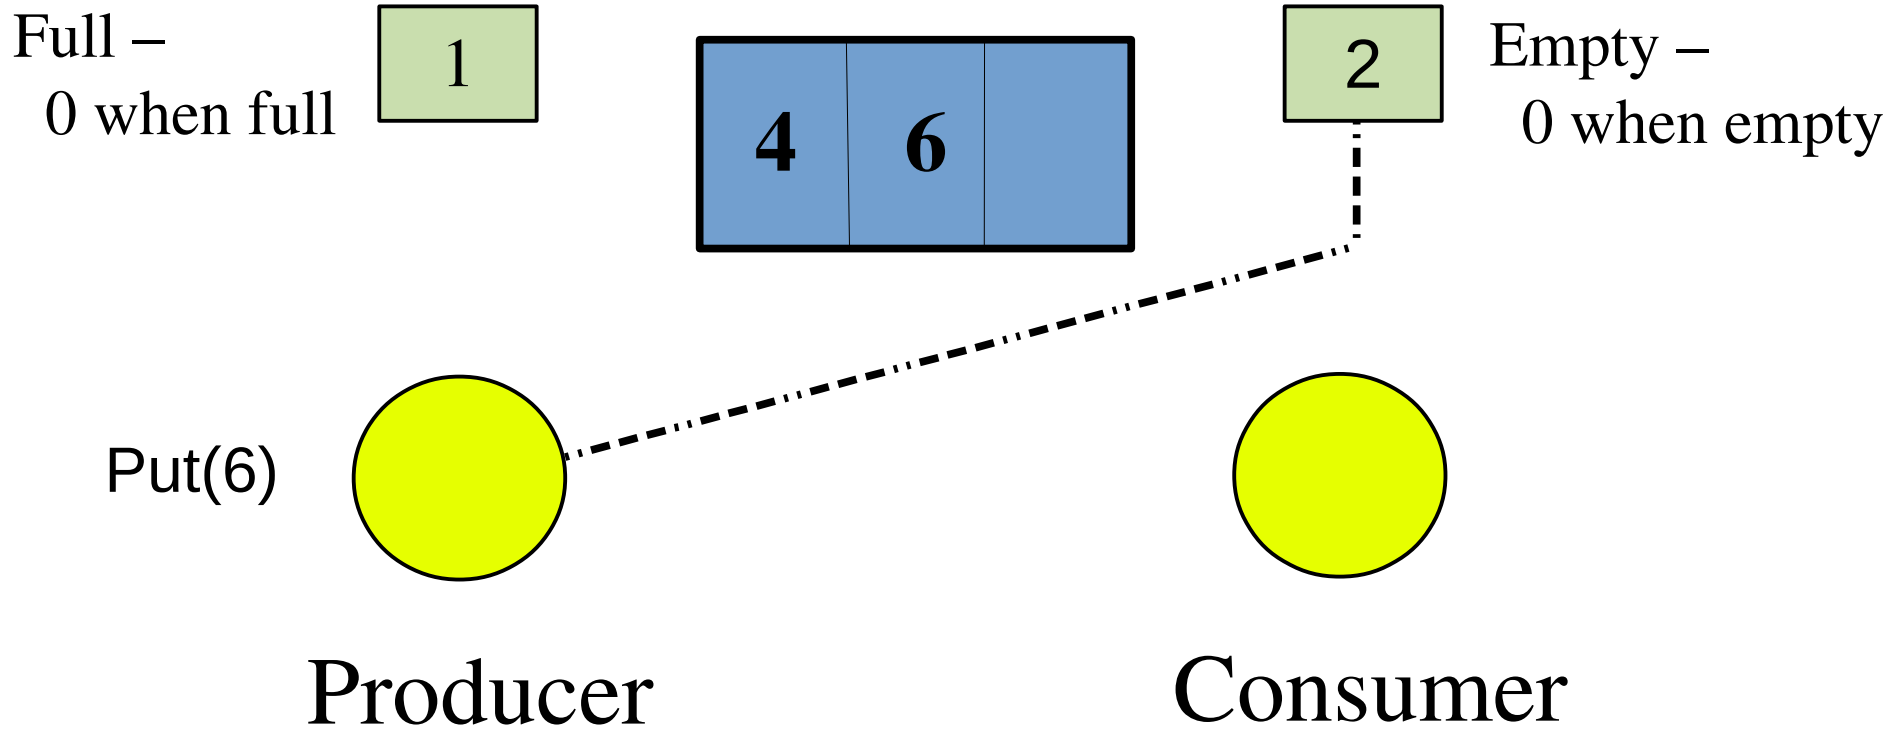

Monitor now has two vacant slots, one slot contains 4  
The Full semaphore's count is checked to be  $> 0$   
It is! So producer passes through and decrements Full's count

# Monitor

Monitor now has one vacant slot, one slot contains 4, one contains 6  
Producer sends a 6 into the Monitor's buffer

# Monitor

Monitor now has one vacant slot, one slot contains 4, one contains 6  
Producer increments the Empty semaphore's count

# Monitor

Full –  
0 when full

1

2

Empty –  
0 when empty

Put(6)

Producer

Consumer

Monitor now has one vacant slot, one slot contains 4, one contains 6  
Producer returns and continues processing

# Monitor

Full –  
0 when full

Empty –  
0 when empty

Producer

Consumer

Monitor now has one vacant slot, one slot contains 4, one contains 6

The Full semaphore's count is 1

The Empty semaphore's count is 2

# Monitor

Full –  
0 when full

Empty –  
0 when empty

Producer

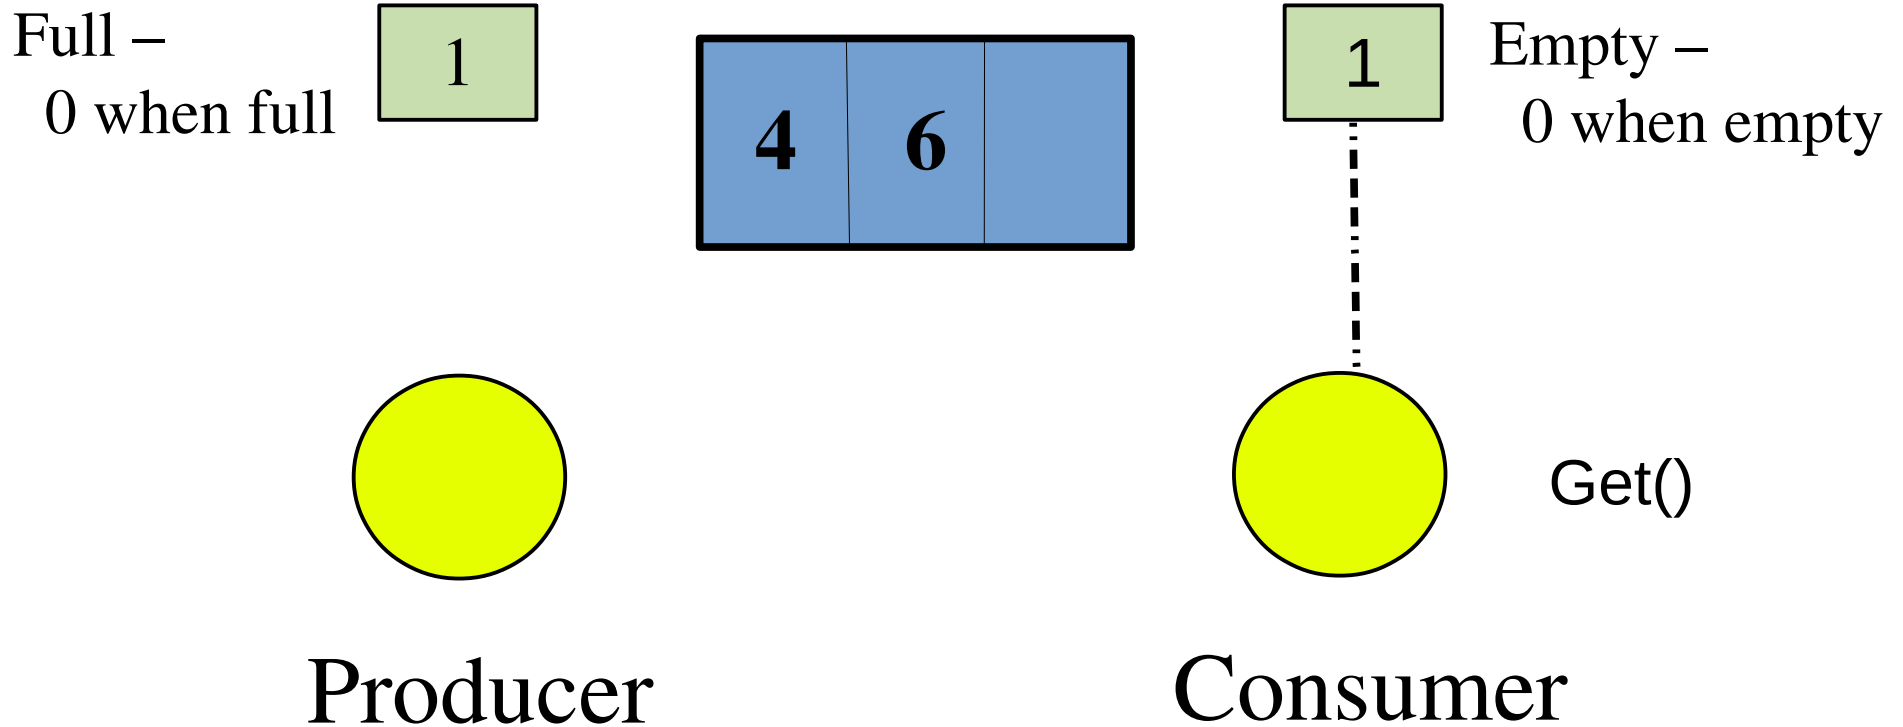

Get()

Consumer

Monitor now has one vacant slot, one slot contains 4, one contains 6  
The Empty semaphore's count is checked to be  $> 0$

# Monitor

Monitor now has one vacant slot, one slot contains 4, one contains 6  
The Empty semaphore's count is checked to be  $> 0$   
It is! So consumer passes through and decrements Empty's count

# Monitor

Full –  
0 when full

Empty –  
0 when empty

Producer

Get()

Consumer

Monitor now has one vacant slot, one slot contains 4, one contains 6  
Consumer continues with get()

# Monitor

Full –  
0 when full

Empty –  
0 when empty

Producer

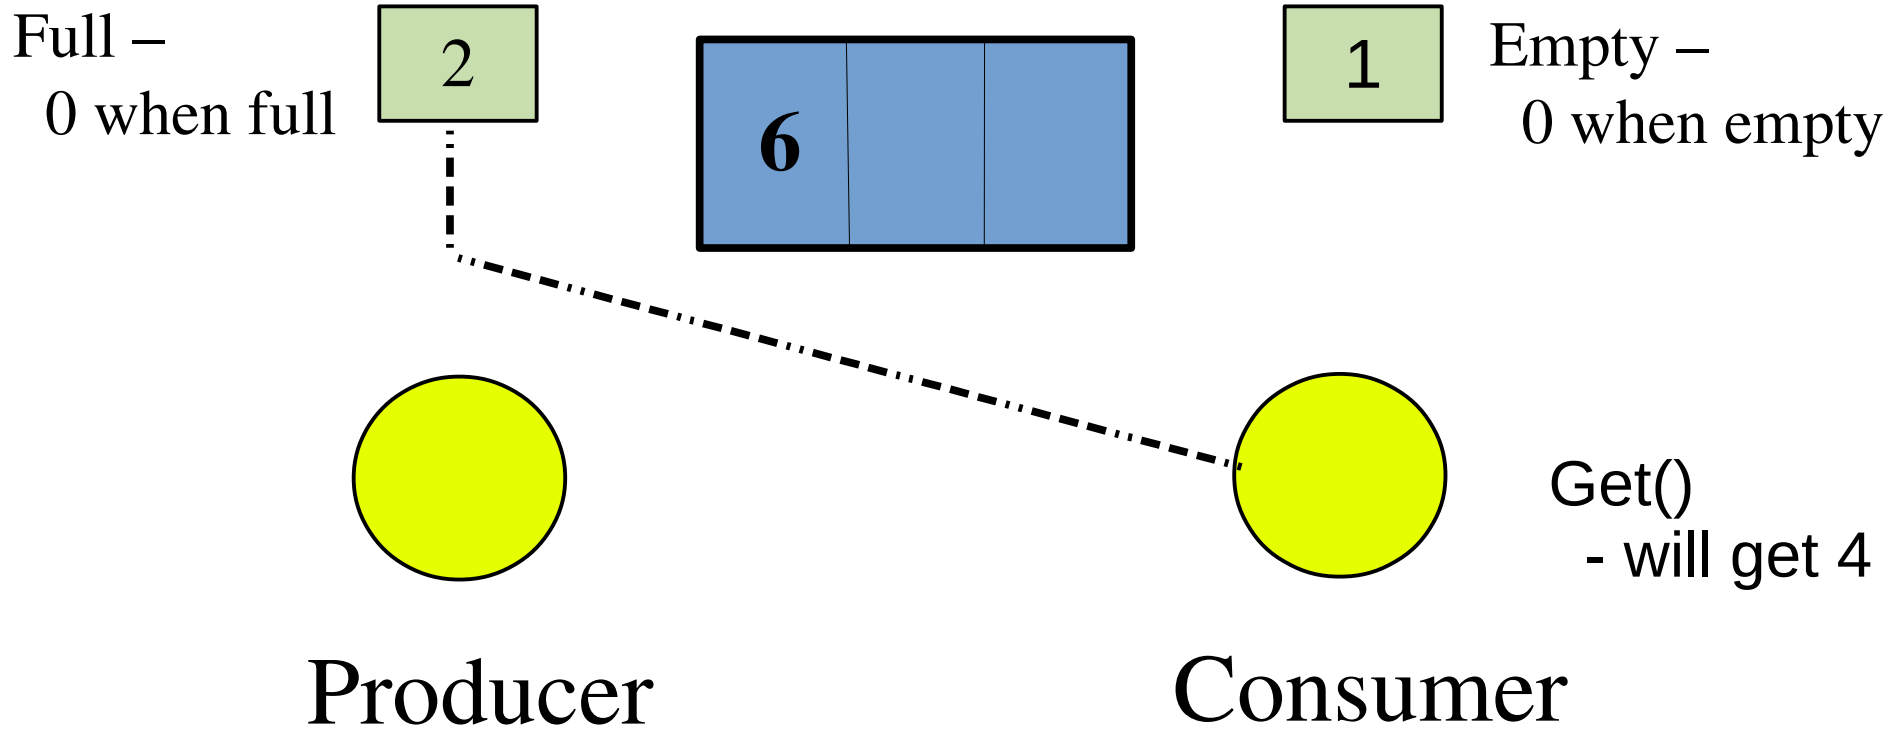

Get()  
- will get 4

Consumer

Monitor now has two vacant slots, one slot contains 6  
Monitor removes 4 from buffer, holds onto it

# Monitor

Monitor now has two vacant slots, one slot contains 6  
Monitor removes 4 from buffer, holds onto it  
Consumer increments the Full semaphore's count

# Monitor

Full –  
0 when full

2

1

Empty –  
0 when empty

4 is returned

Producer

Get()

Consumer

Monitor now has two vacant slots, one slot contains 6  
Monitor sends 4 to the consumer

# Monitor

Full –  
0 when full

2

1

Empty –  
0 when empty

Producer

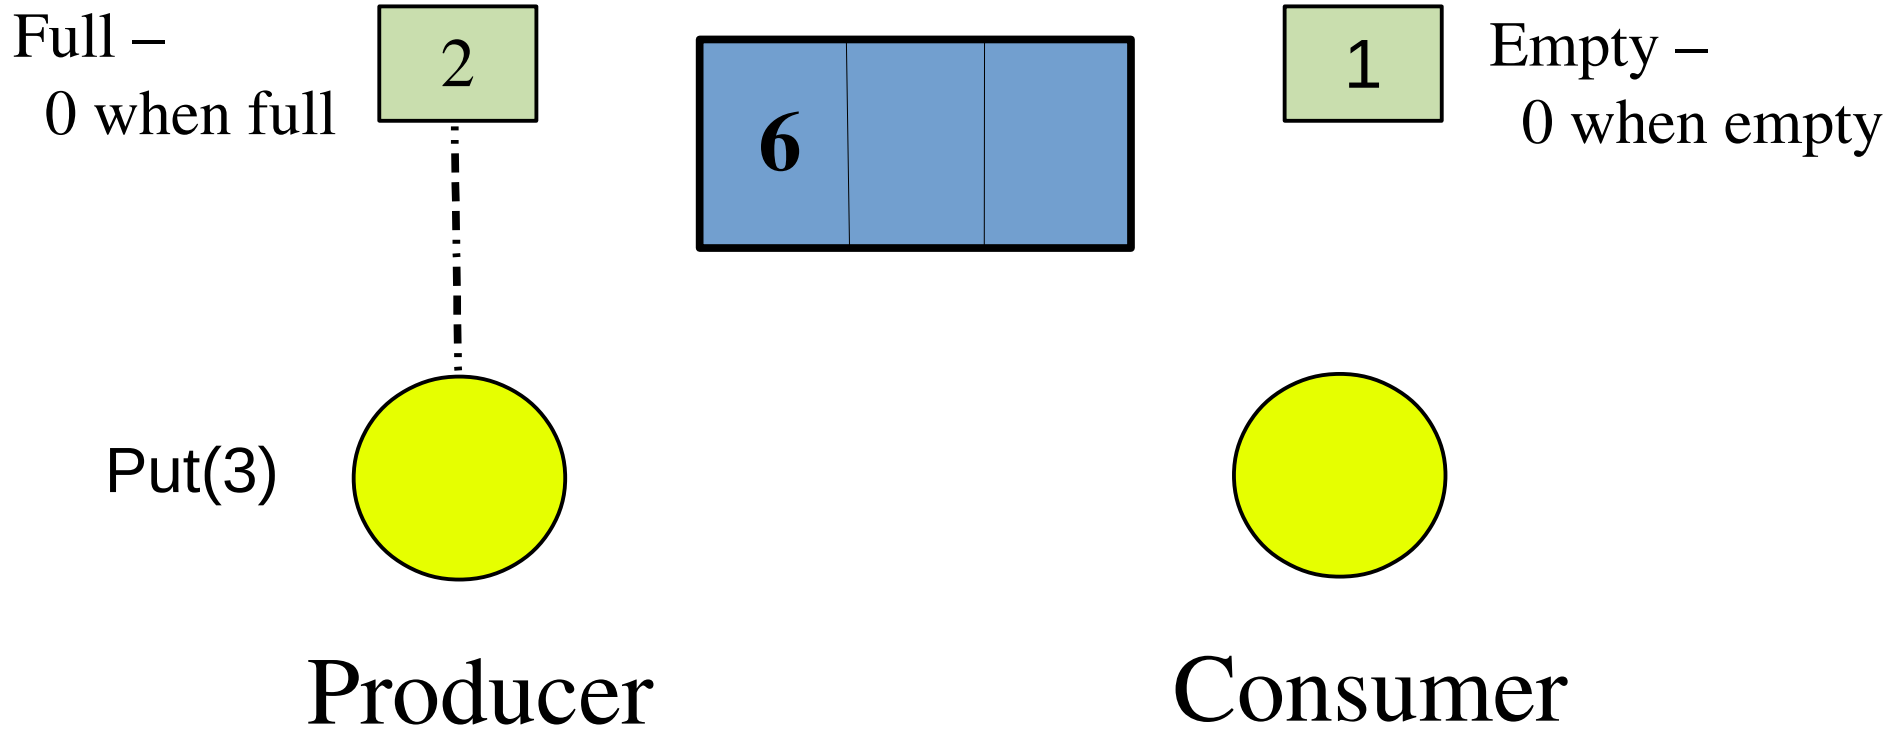

Consumer

Monitor now has two vacant slots, one slot contains 6

The Full semaphore count is 2

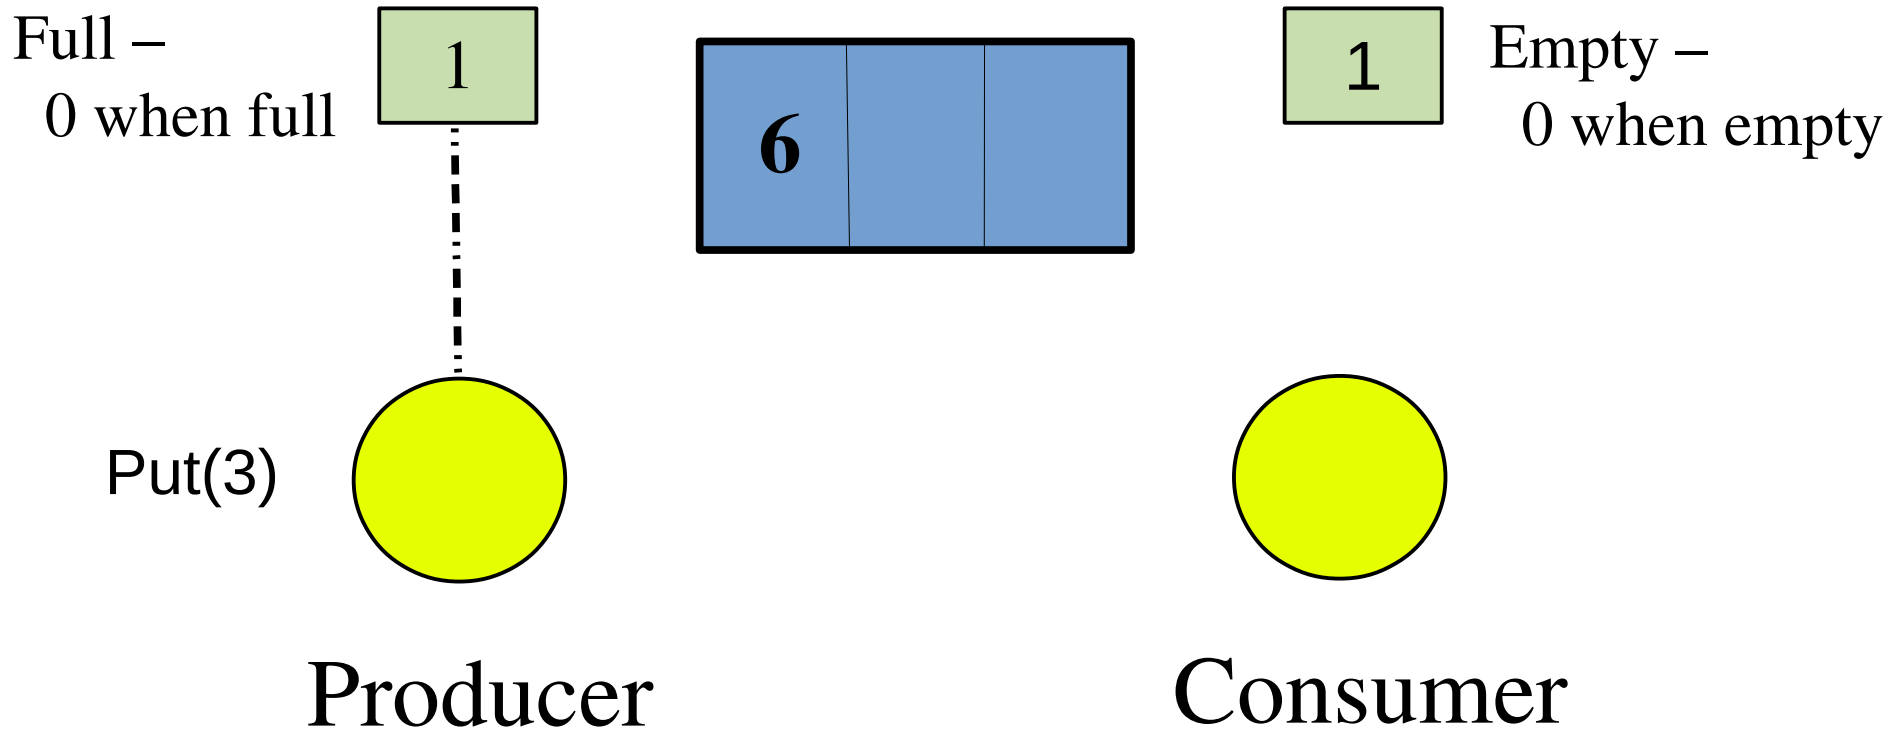

The Empty semaphore count is 1

# Monitor

Monitor now has two vacant slots, one slot contains 6  
The Full semaphore's count is checked to be  $> 0$

# Monitor

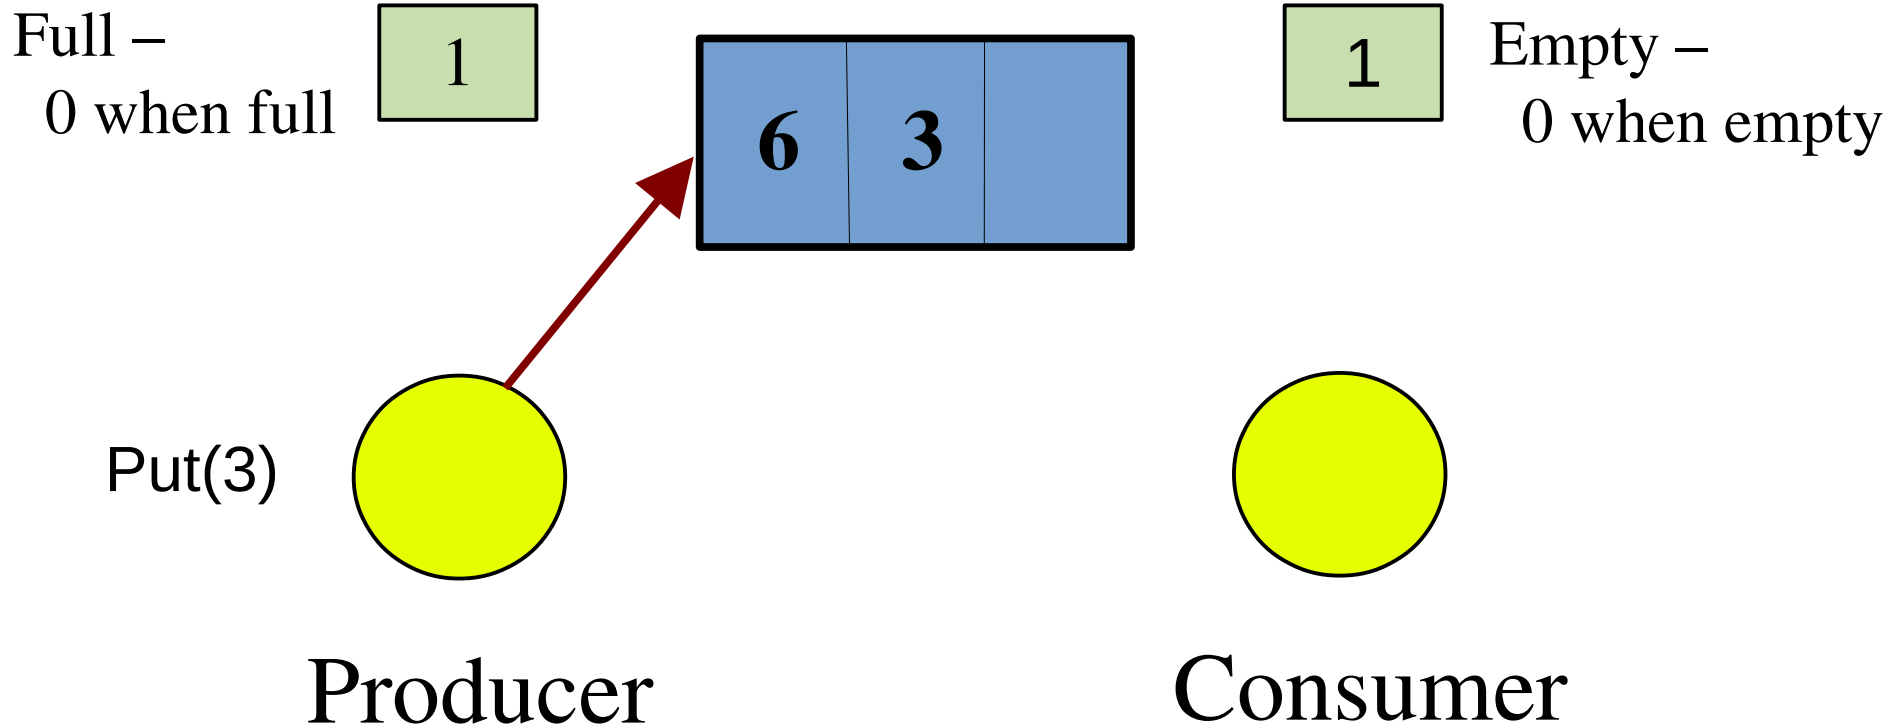

Monitor now has two vacant slots, one slot contains 6

The Full semaphore's count is checked to be  $> 0$

It is! So producer passes through and decrements Full's count

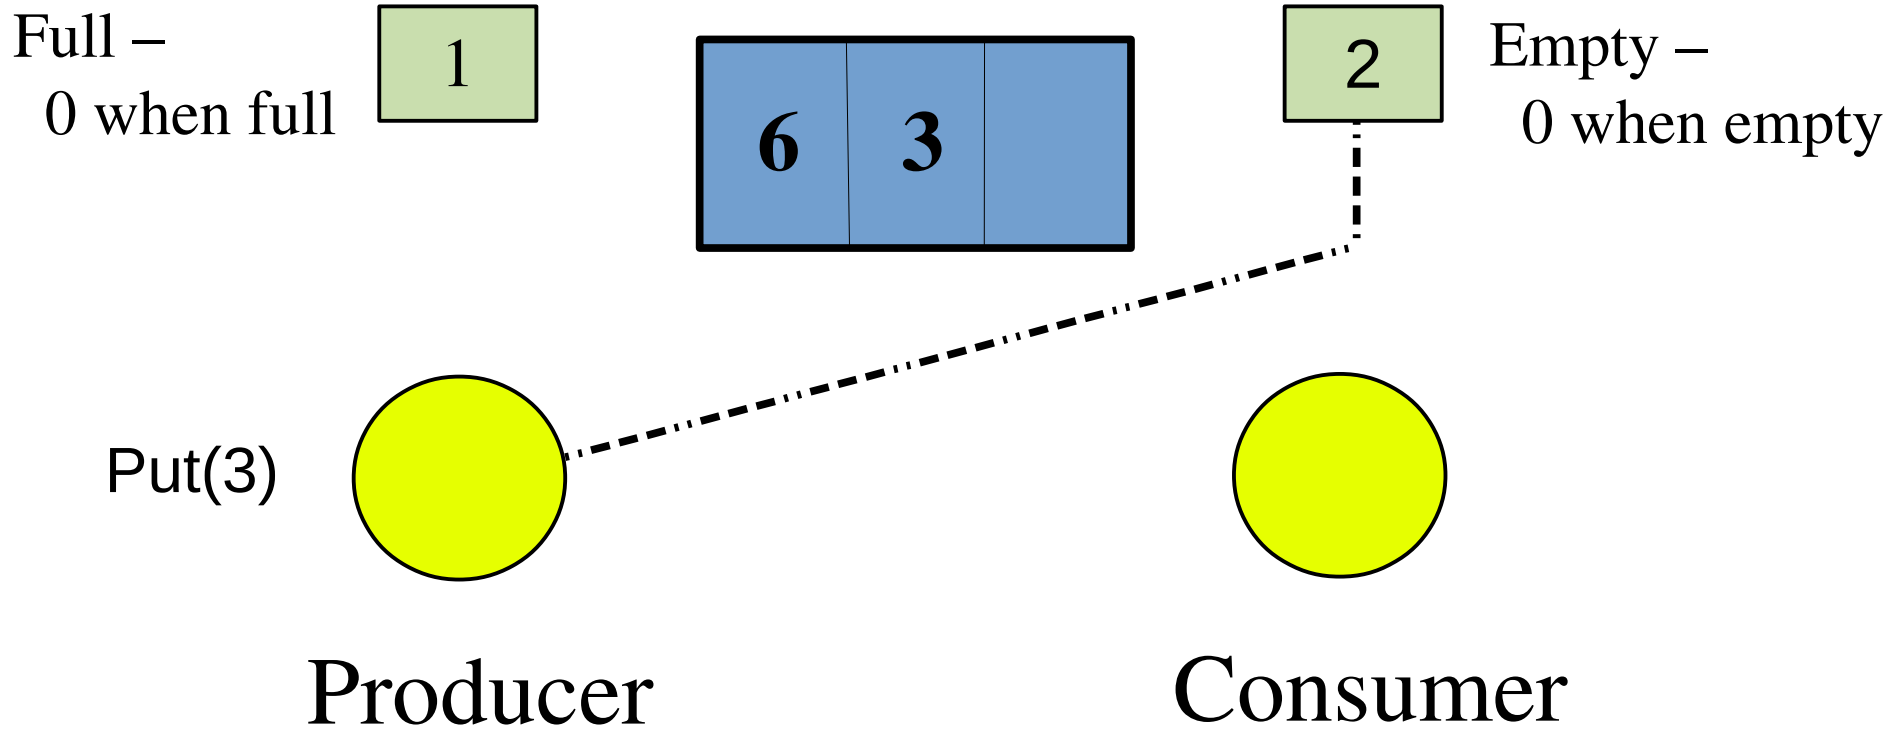

# Monitor

Monitor now has one vacant slot, one slot contains 6, one contains 3  
Producer sends 3 to the Monitor's buffer

# Monitor

Monitor now has one vacant slot, one slot contains 6, one contains 3  
The Empty semaphore's count is incremented by 1

# Monitor

Full –  
0 when full

Empty –  
0 when empty

Put(3)

Producer

Consumer

Monitor now has one vacant slot, one slot contains 6, one contains 3  
Producer continues processing

# Monitor

Full –  
0 when full

Empty –  
0 when empty

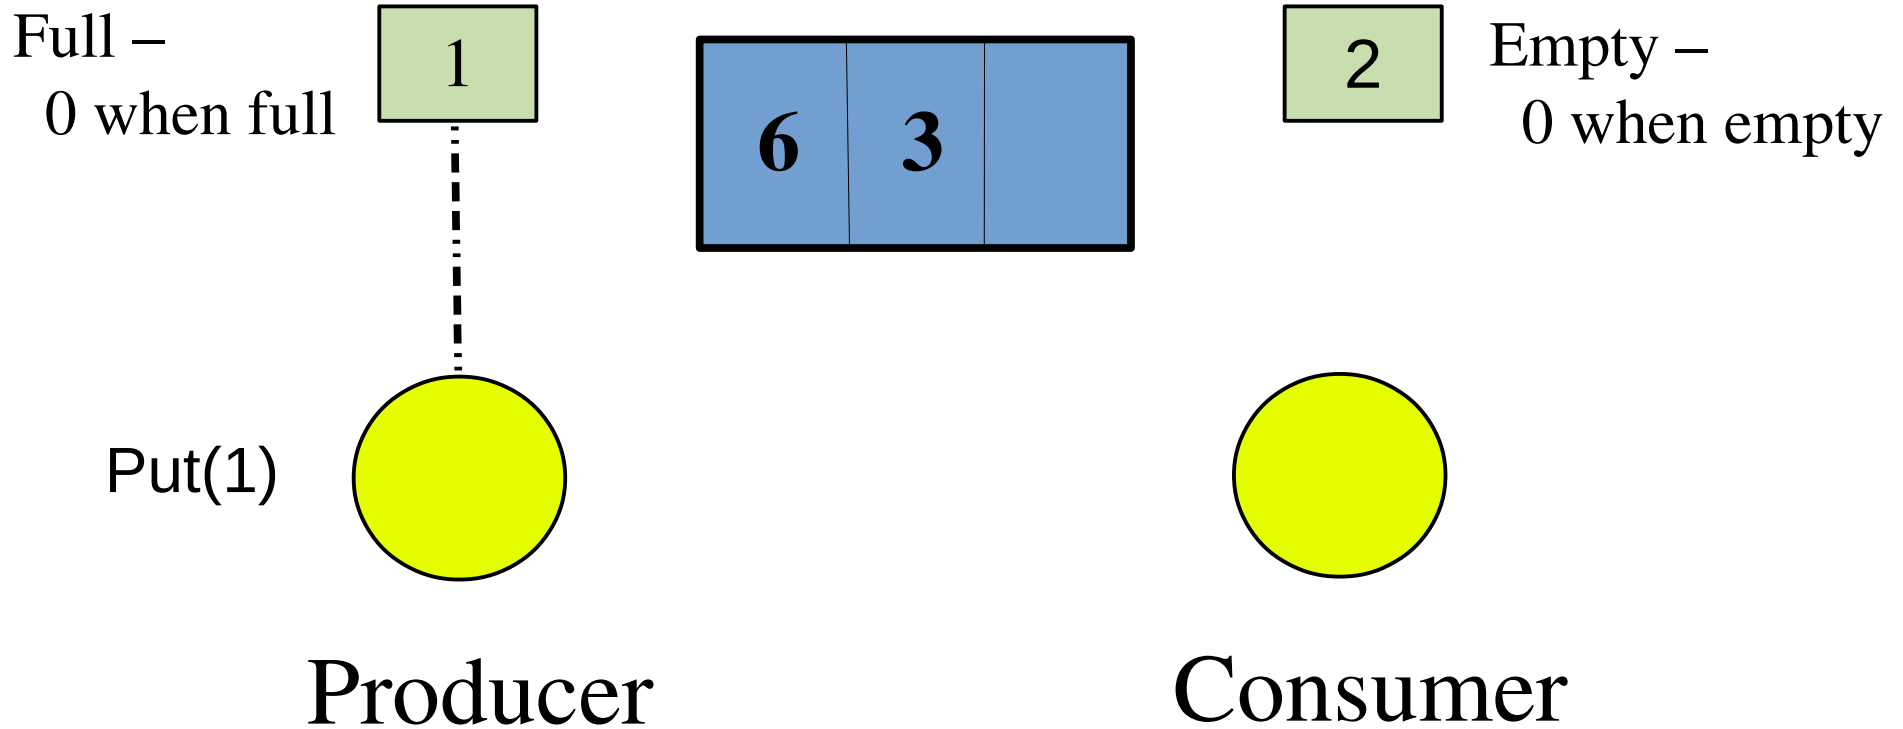

Producer

Consumer

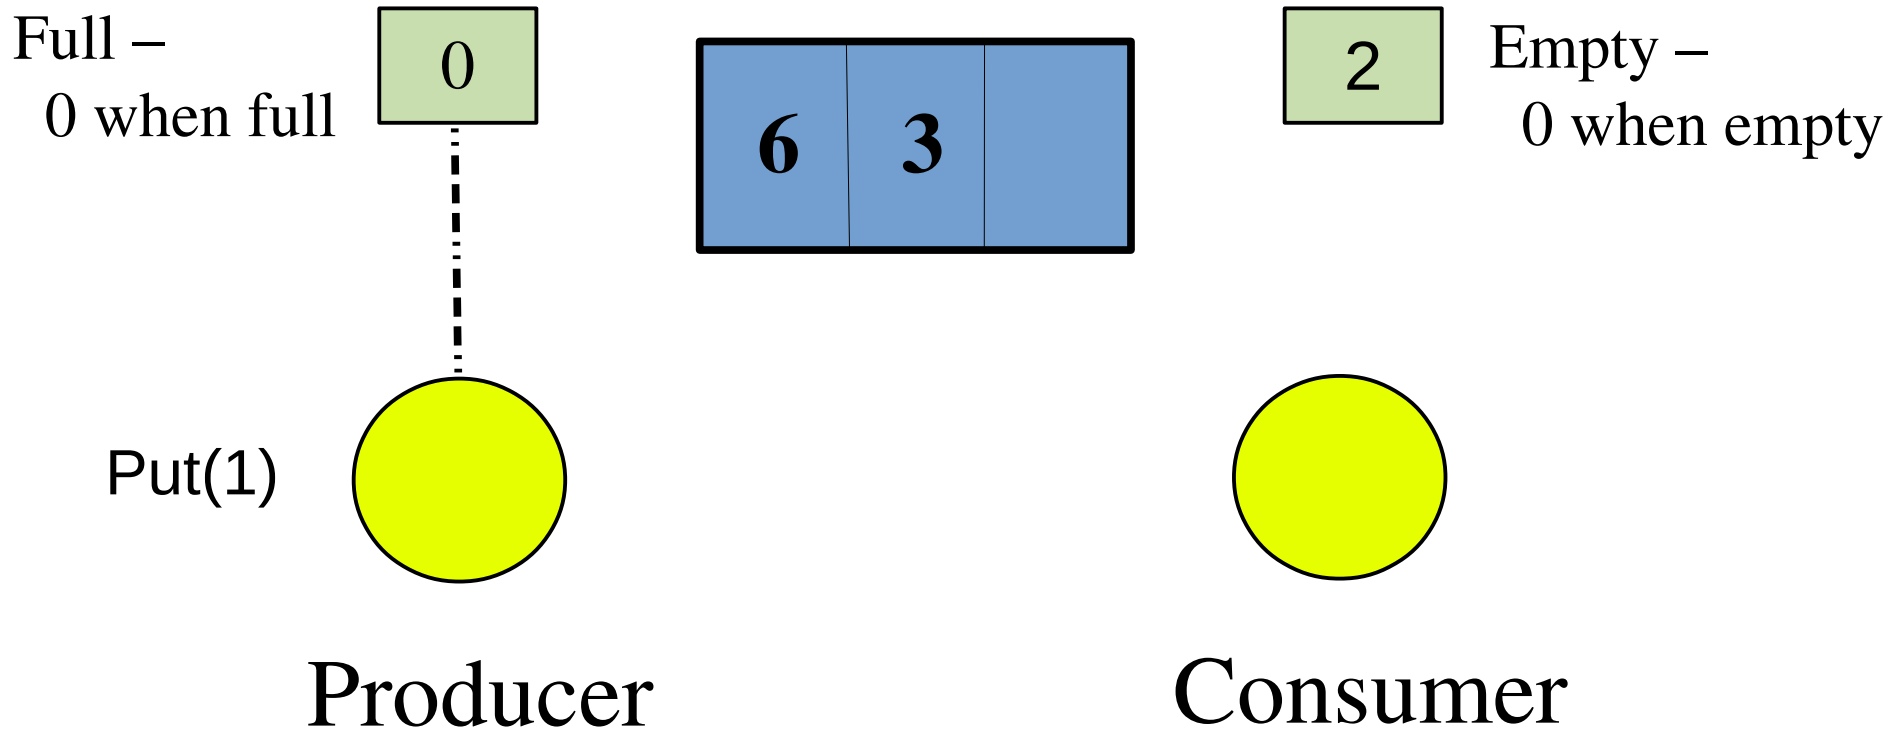

Monitor now has one vacant slot, one slot contains 6, one contains 3  
The Full semaphore's count is 1  
The Empty semaphore's count is 2

# Monitor

Monitor now has one vacant slot, one slot contains 6, one contains 3  
The Full semaphore count is checked to be  $> 0$

# Monitor

Monitor now has one vacant slot, one slot contains 6, one contains 3  
The Full semaphore count is checked to be  $> 0$   
It is! So the producer passes through and decrements Full's count

# Monitor

Full –  
0 when full

0

2

Empty –  
0 when empty

Put(1)

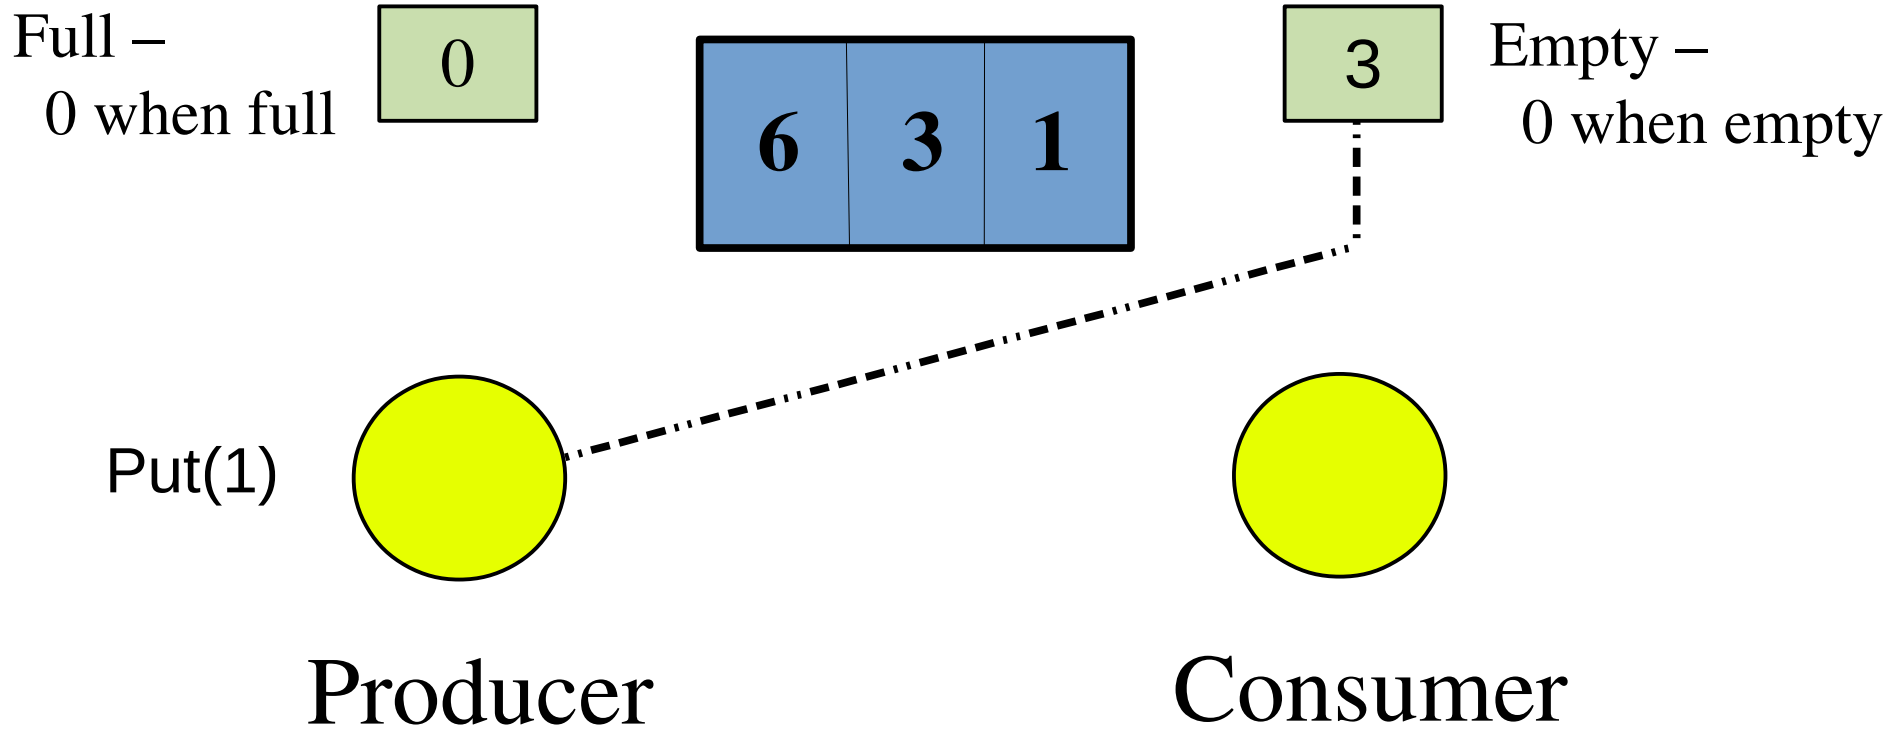

Producer

Consumer

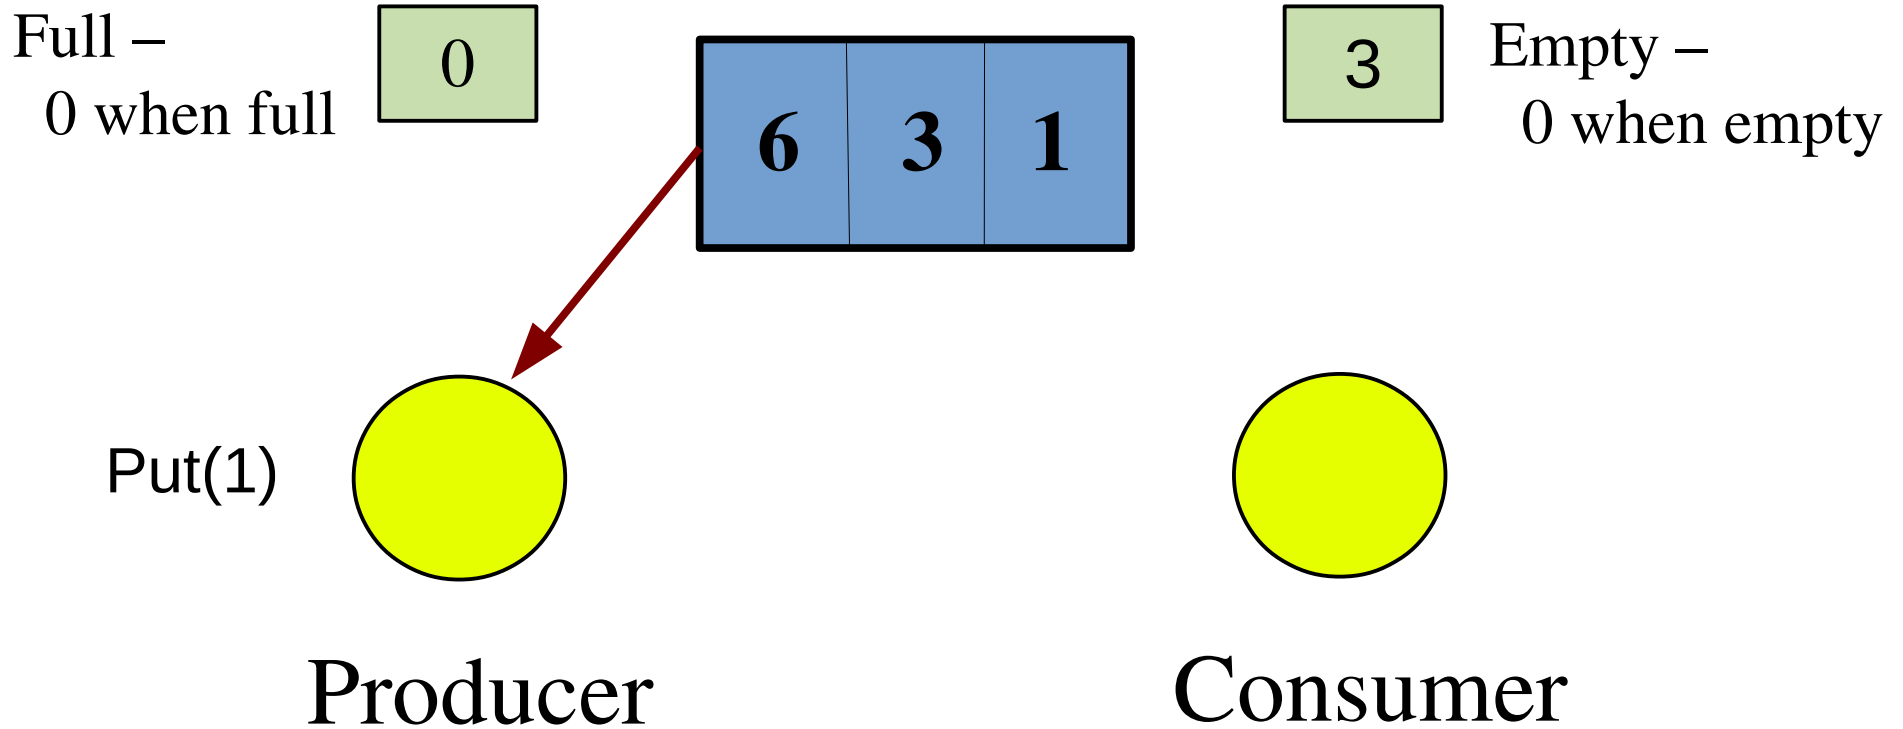

Monitor now has one slot with 6, one slot with 3, one slot with 1  
Producer sends 1 to the Monitor's buffer

# Monitor

Monitor now has one slot with 6, one slot with 3, one slot with 1  
The Empty semaphore's count is incremented

# Monitor

Monitor now has one slot with 6, one slot with 3, one slot with 1  
The Empty semaphore's count is incremented  
Producer returns from put and continues processing

# Monitor

Full –  
0 when full

0

3

Empty –  
0 when empty

Producer

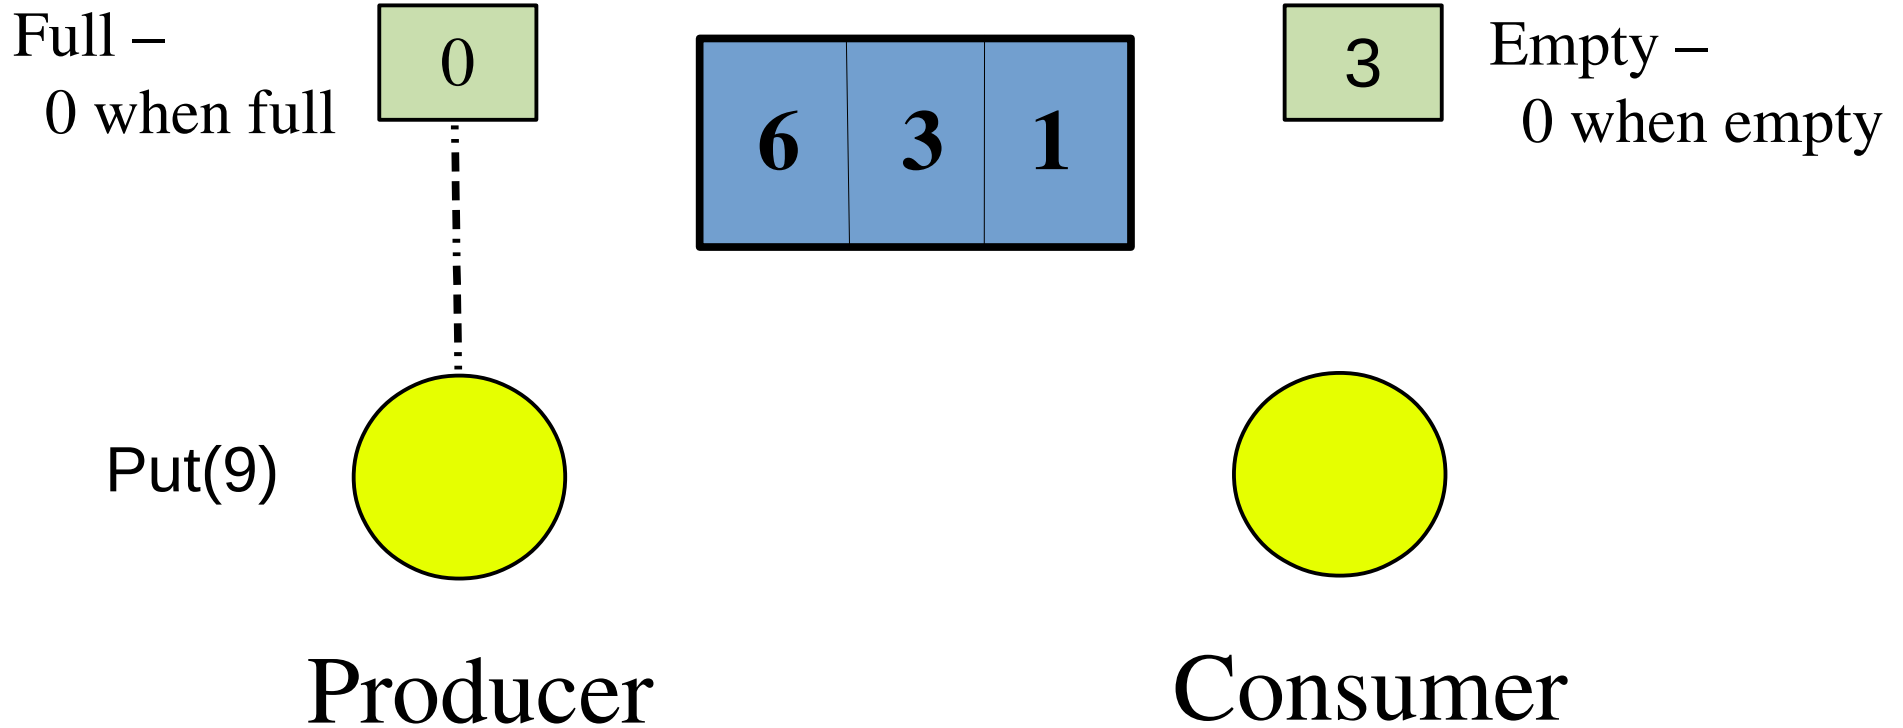

Consumer

Monitor now has one slot with 6, one slot with 3, one slot with 1

The Full semaphore's count is 0

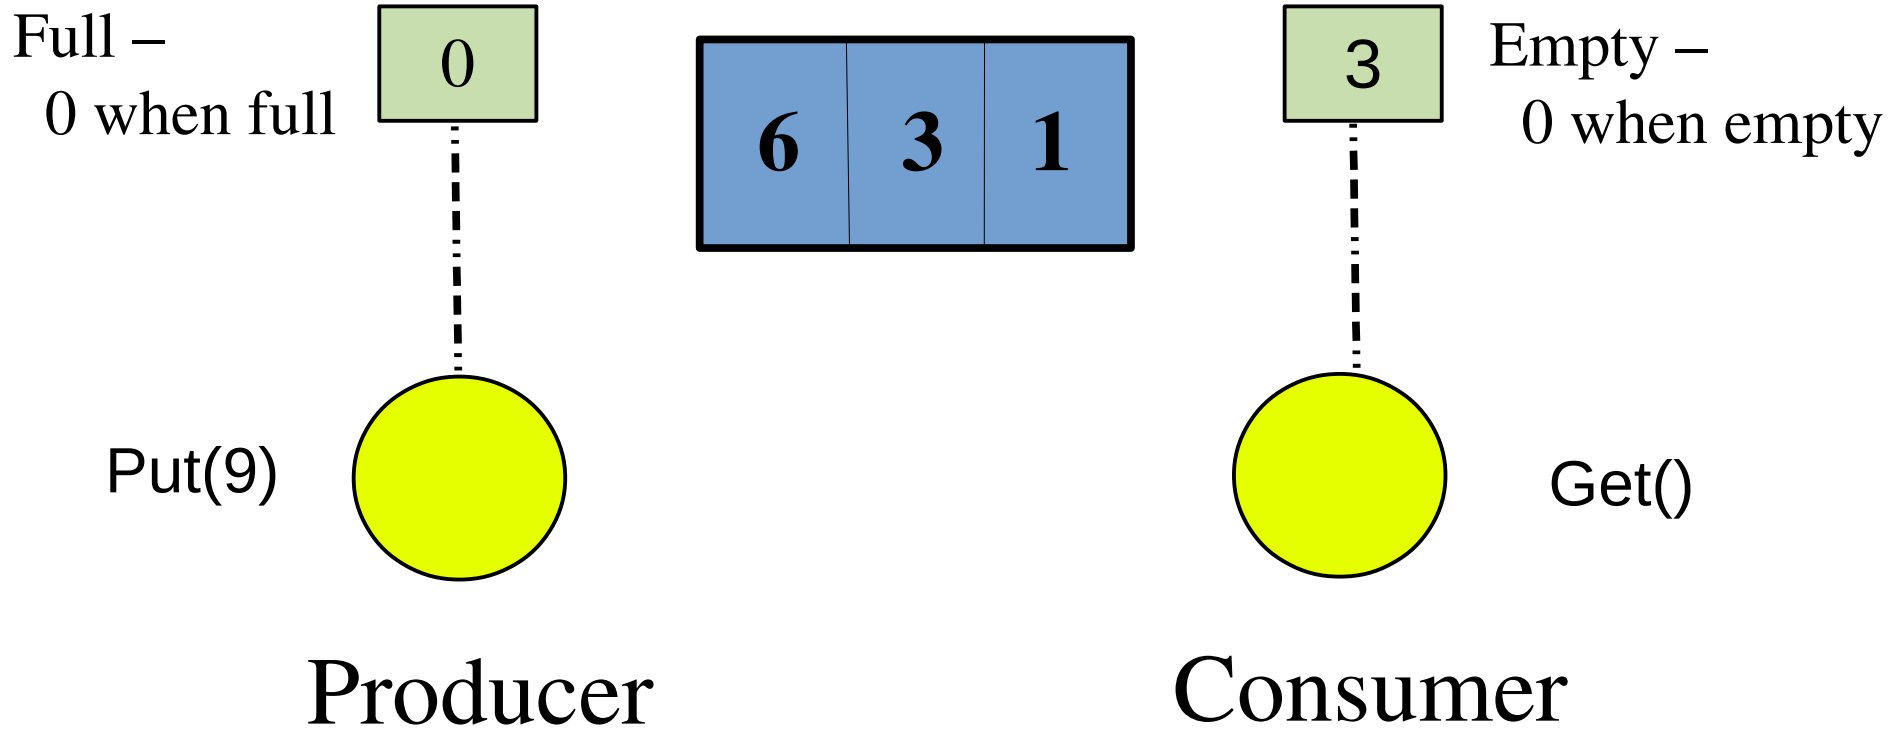

The Empty semaphore's count is 3

# Monitor

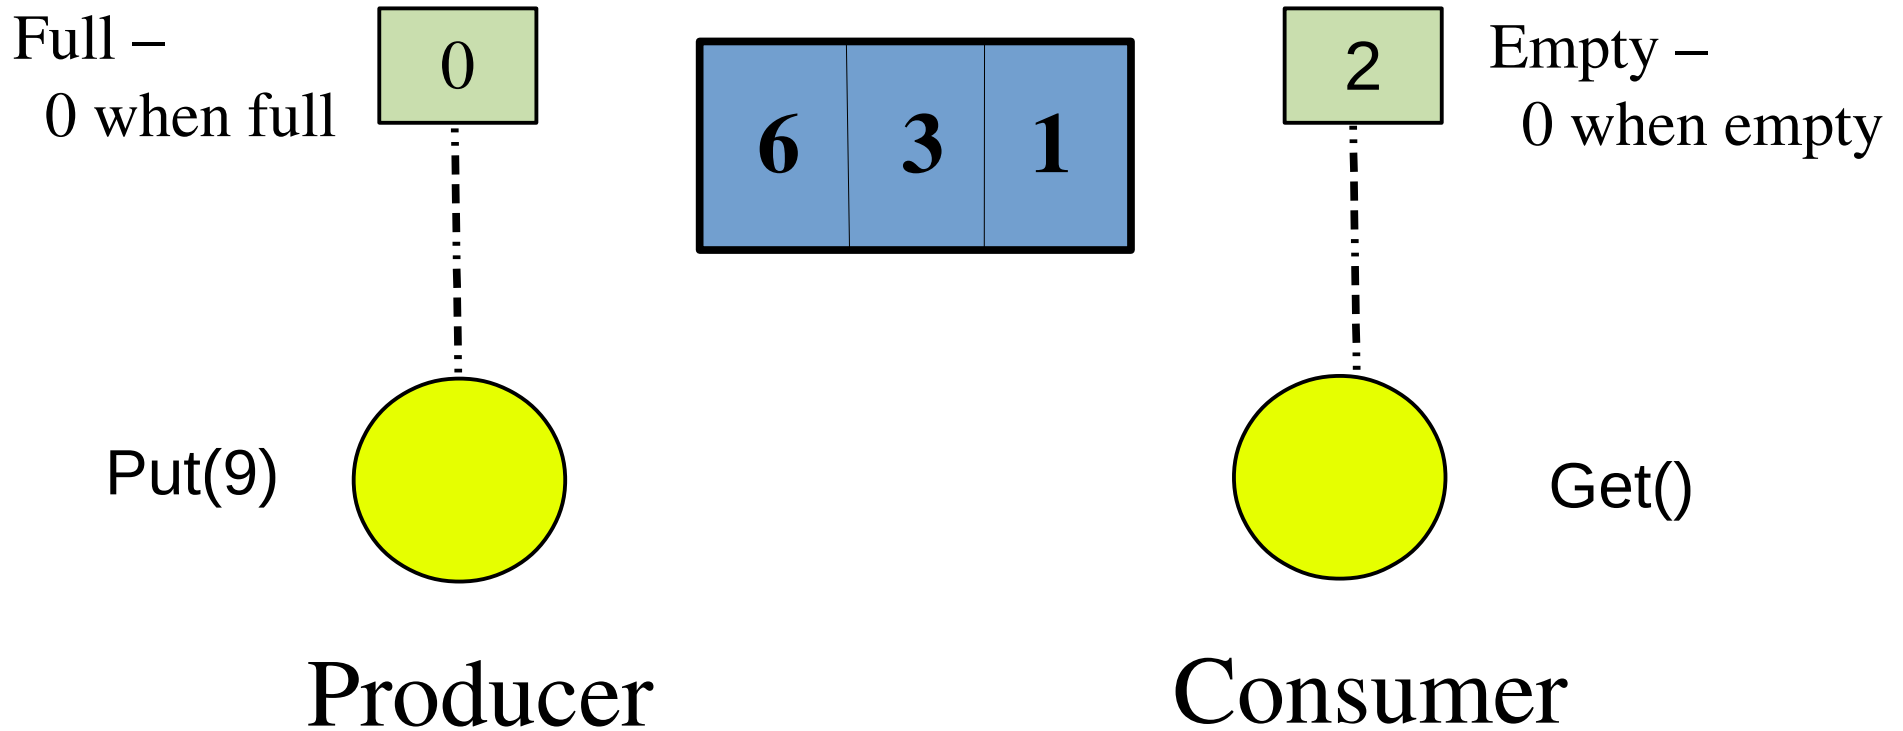

Monitor now has one slot with 6, one slot with 3, one slot with 1  
The Full semaphore's count is checked but is 0, producer is blocked!

# Monitor

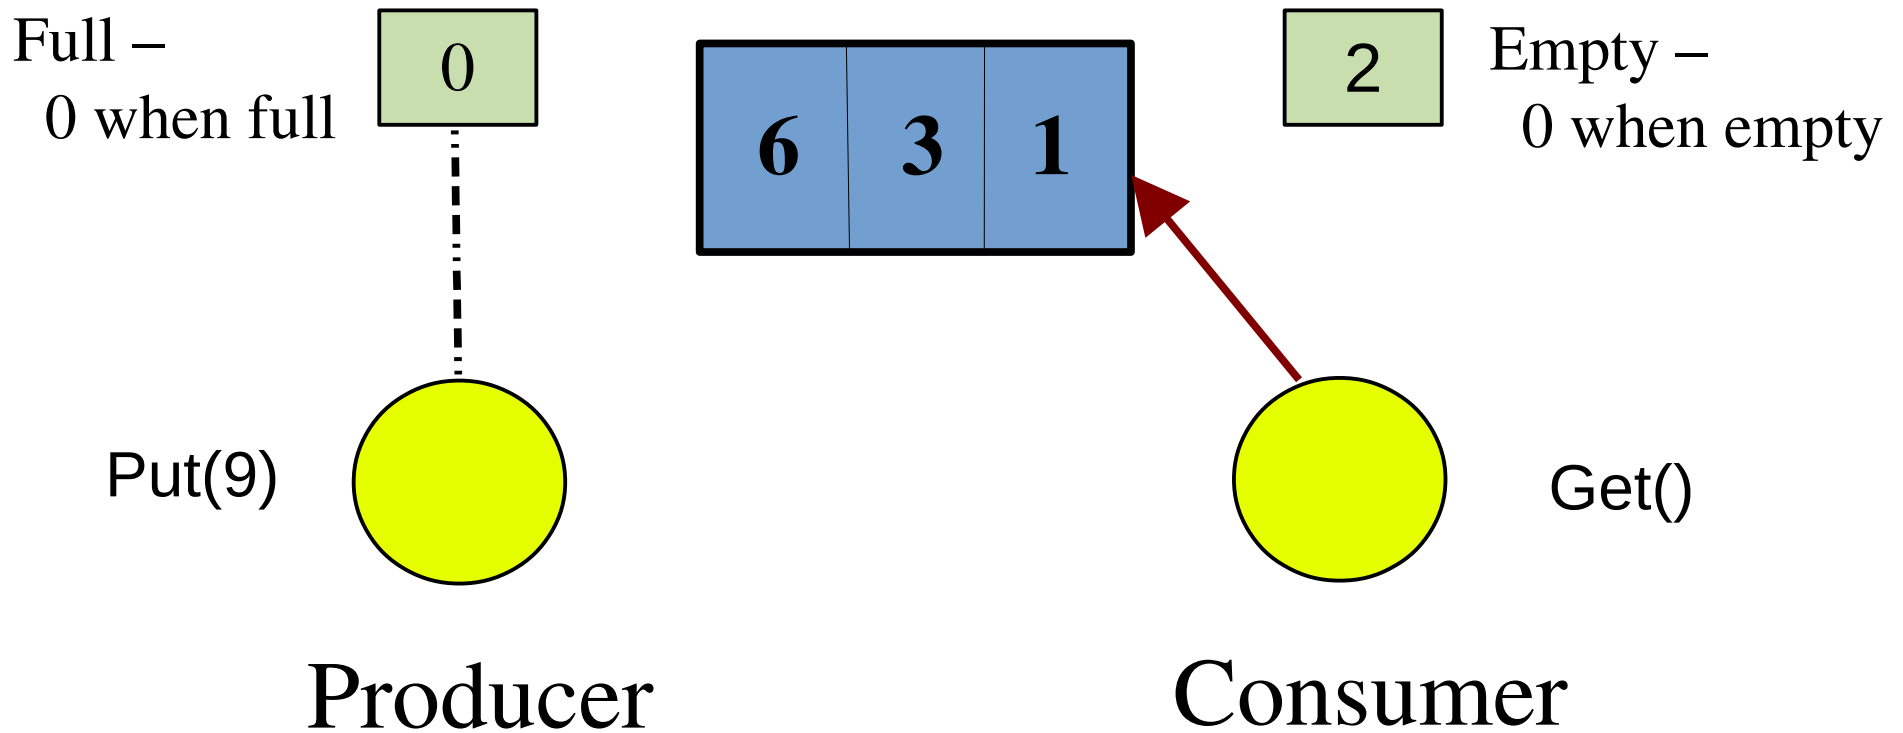

Monitor now has one slot with 6, one slot with 3, one slot with 1  
The Full semaphore's count is checked but is 0, producer is blocked!  
The Empty semaphore's count is checked to be  $> 0$

# Monitor

Monitor now has one slot with 6, one slot with 3, one slot with 1  
The Full semaphore's count is checked but is 0, producer is blocked!  
The Empty semaphore's count is checked to be  $> 0$   
It is! So consumer passes through and decrements Empty's count

# Monitor

Monitor now has one slot with 6, one slot with 3, one slot with 1  
The Full semaphore's count is checked but is 0, producer is blocked!  
Consumer requests a token from the Monitor

# Monitor

Full –  
0 when full

0

2

Empty –  
0 when empty

Put(9)

Producer

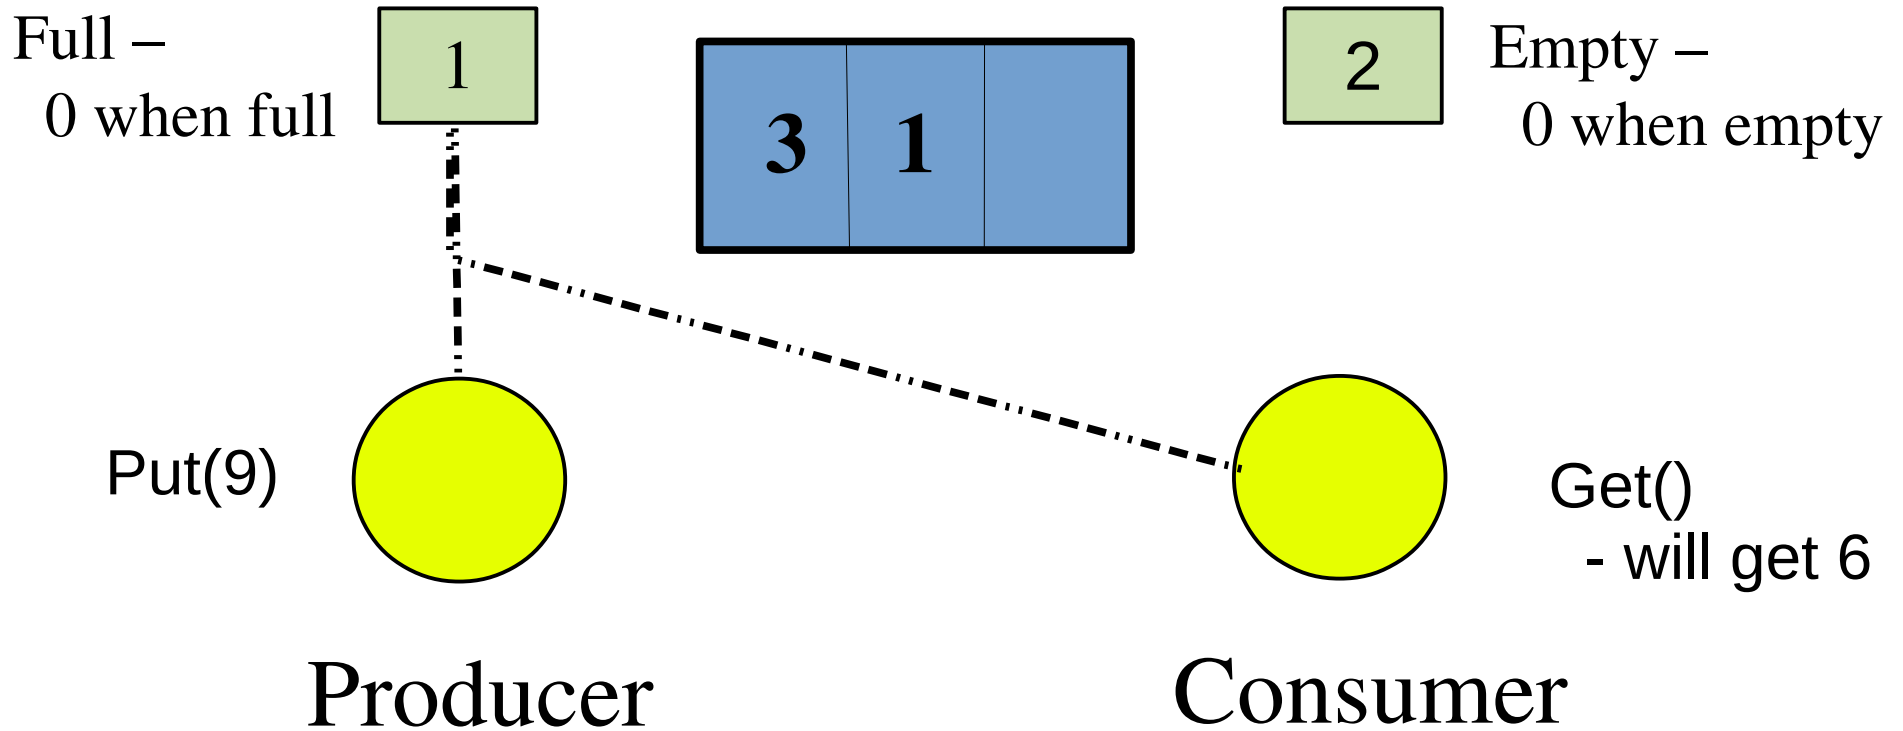

Get()  
- will get 6

Consumer

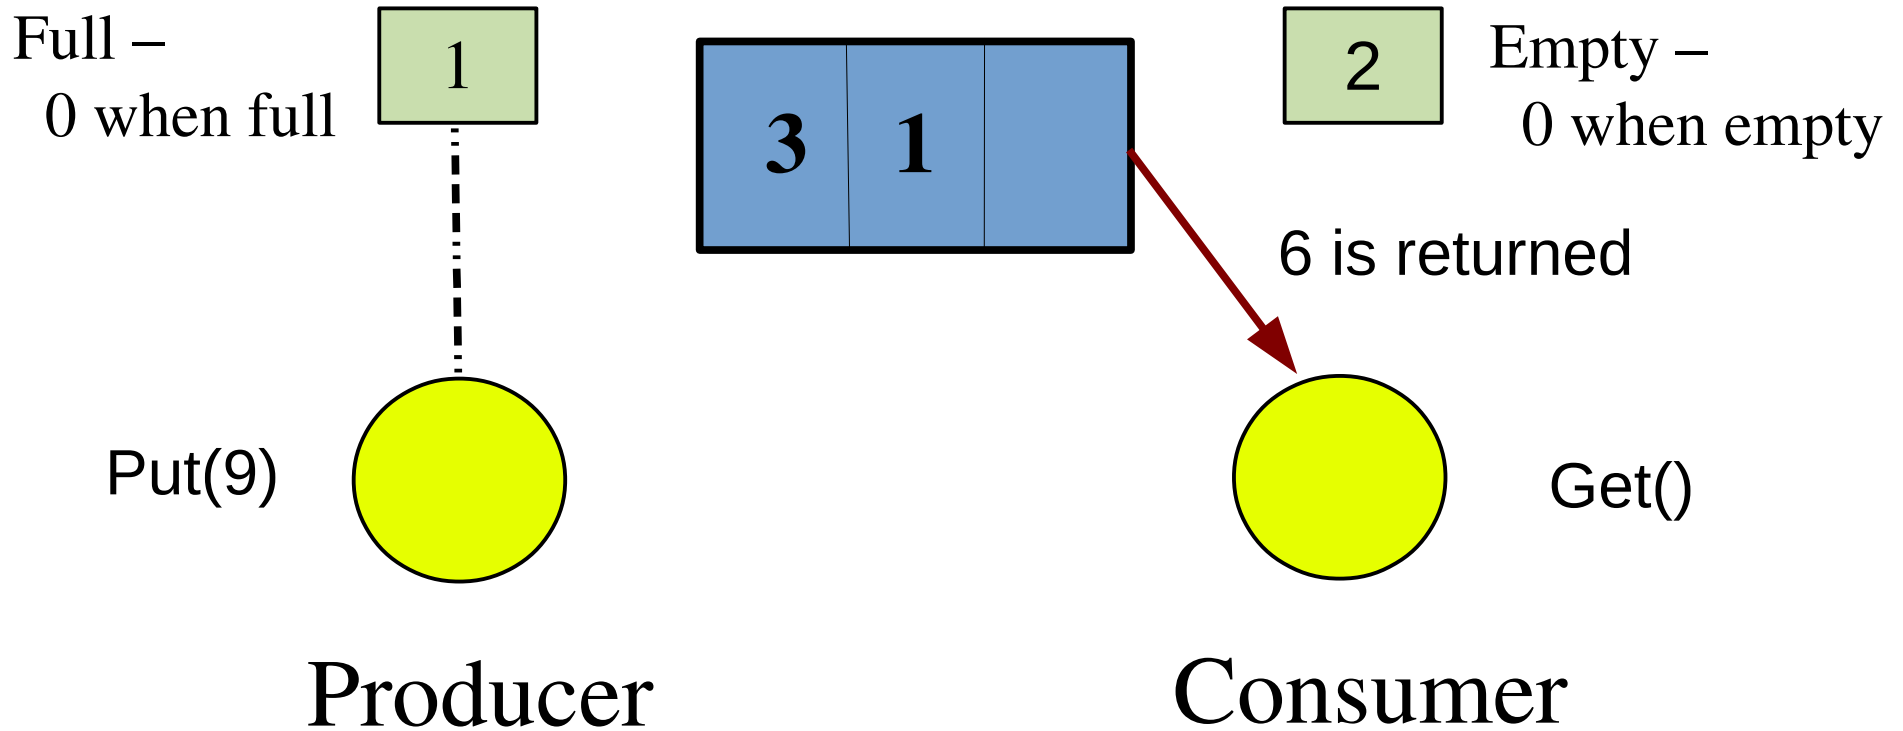

Monitor now has one vacant slot, one slot with 3, one slot with 1  
Monitor removes 6 from buffer, holds onto it

# Monitor

Monitor now has one vacant slot, one slot with 3, one slot with 1  
Monitor removes 6 from buffer, holds onto it  
The Full semaphore's count is incremented

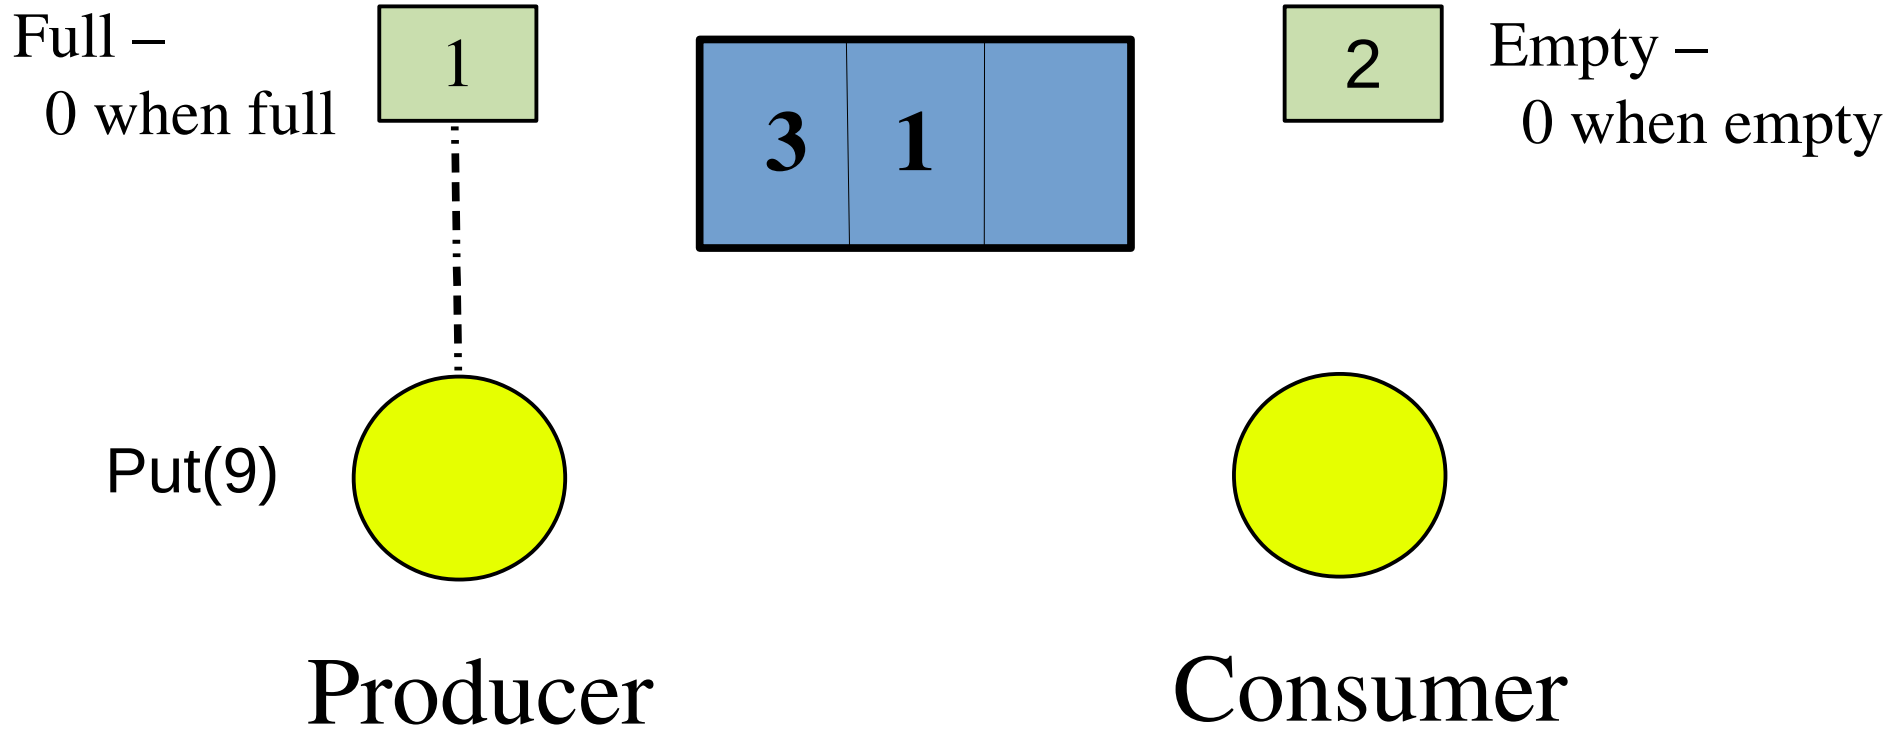

# Monitor

Monitor now has one vacant slot, one slot with 3, one slot with 1  
Monitor sends 6 to the consumer, consumer continues processing

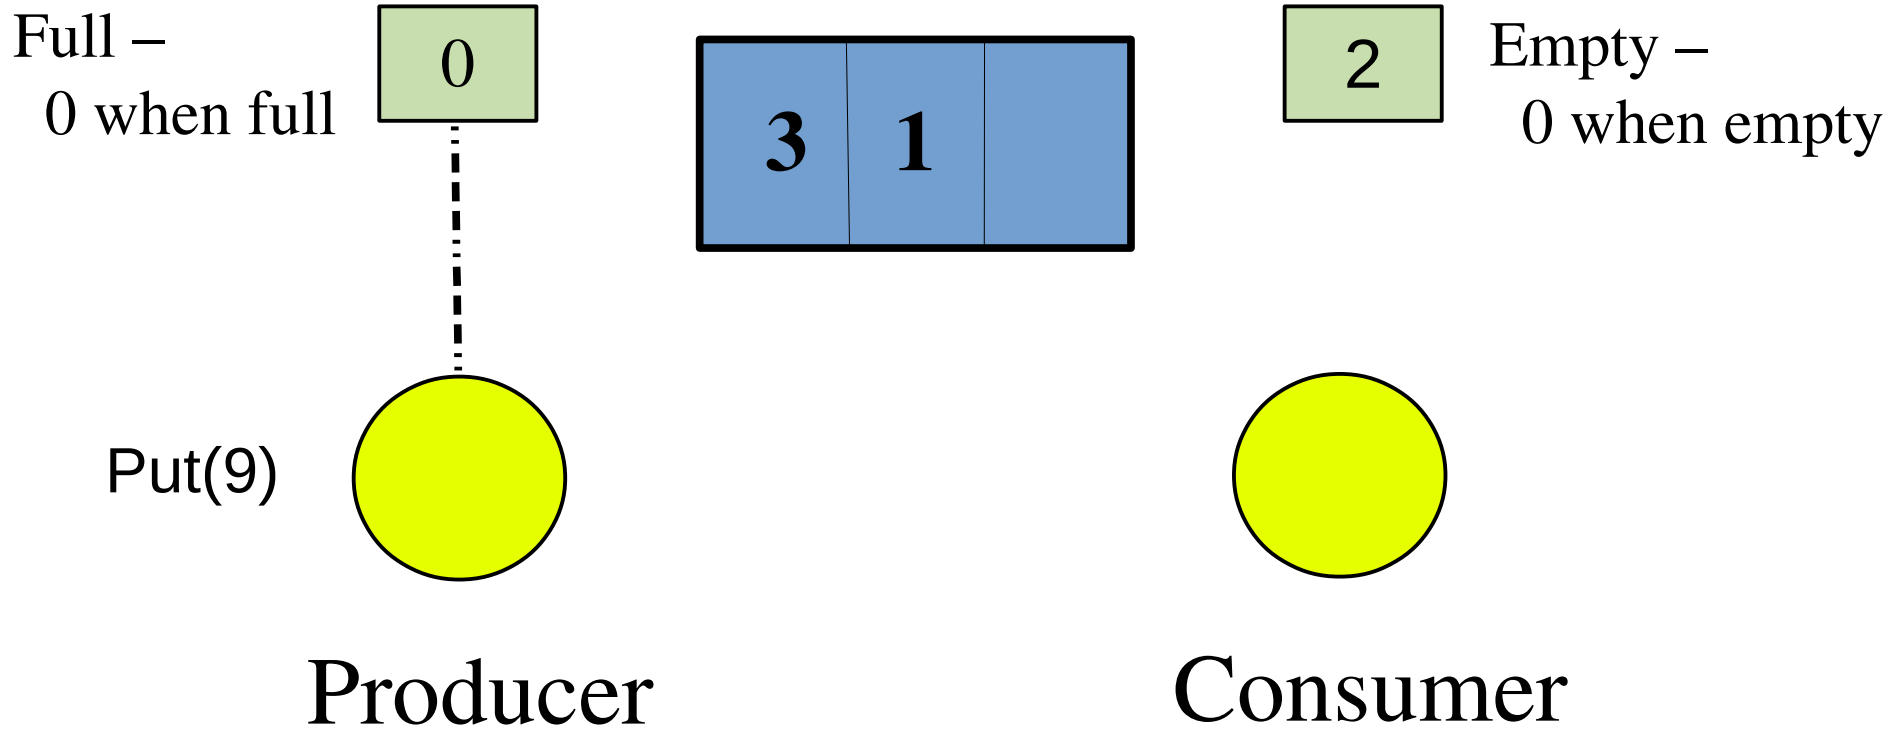

# Monitor

Monitor now has one vacant slot, one slot with 3, one slot with 1  
Producer is no longer blocked, continues

# Monitor

Monitor now has one vacant slot, one slot with 3, one slot with 1  
Producer is no longer blocked, continues  
The Full semaphore's count is decremented

# Monitor

Full –  
0 when full

0

2

Empty –  
0 when empty

Put(9)

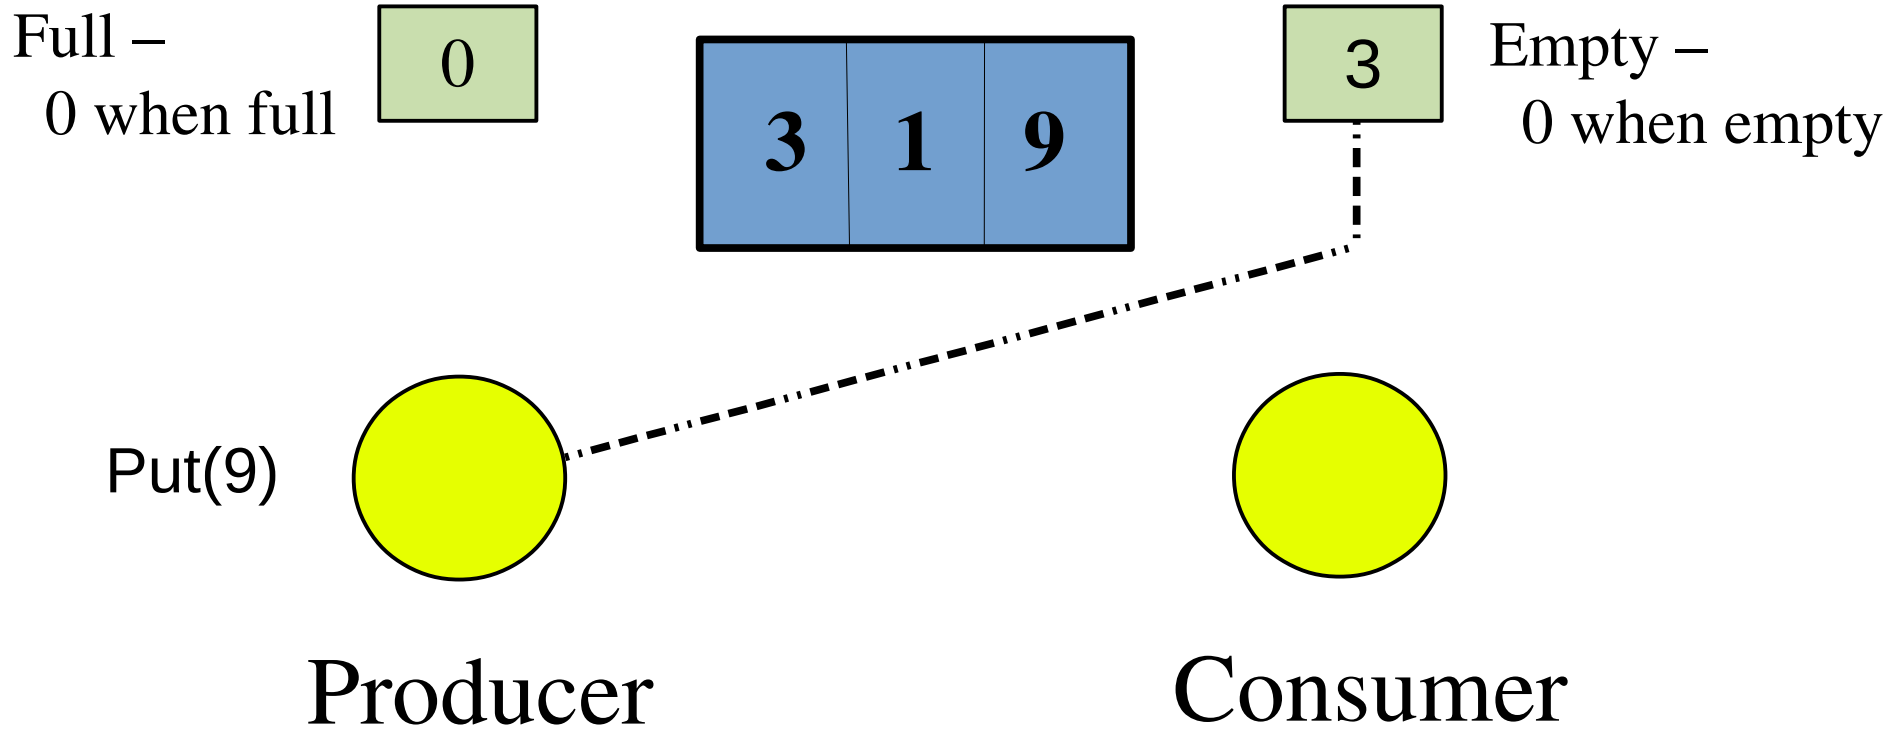

Producer

Consumer

Monitor now has one slot with 3, one slot with 1, one slot with 9  
Producer sends 9 to the Monitor's buffer

# Monitor

Monitor now has one slot with 3, one slot with 1, one slot with 9  
The Empty semaphore's count is incremented

# Monitor

Full –  
0 when full

0

3

Empty –  
0 when empty

Put(9)

Producer

Consumer

Monitor now has one slot with 3, one slot with 1, one slot with 9  
Producer continues processing

# Monitor

Full –  
0 when full

0

3

Empty –  
0 when empty

Producer

Consumer

Monitor now has one slot with 3, one slot with 1, one slot with 9

The Full semaphore's count is 0

The Empty semaphore's count is 3

**Consumer gets three tokens from Monitor**

# Monitor

Full –  
0 when full

3

0

Empty –  
0 when empty

Producer

Consumer

Monitor buffer is empty

# Monitor

Full –  
0 when full

3

0

Empty –  
0 when empty

Producer

Get()

Consumer

Monitor buffer is empty

The Empty semaphore's count is checked but is 0, consumer blocked!

# Monitor

Monitor buffer is empty

The Empty semaphore's count is checked but is 0, consumer blocked!

The Full semaphore's count is checked to be  $> 0$

# Monitor

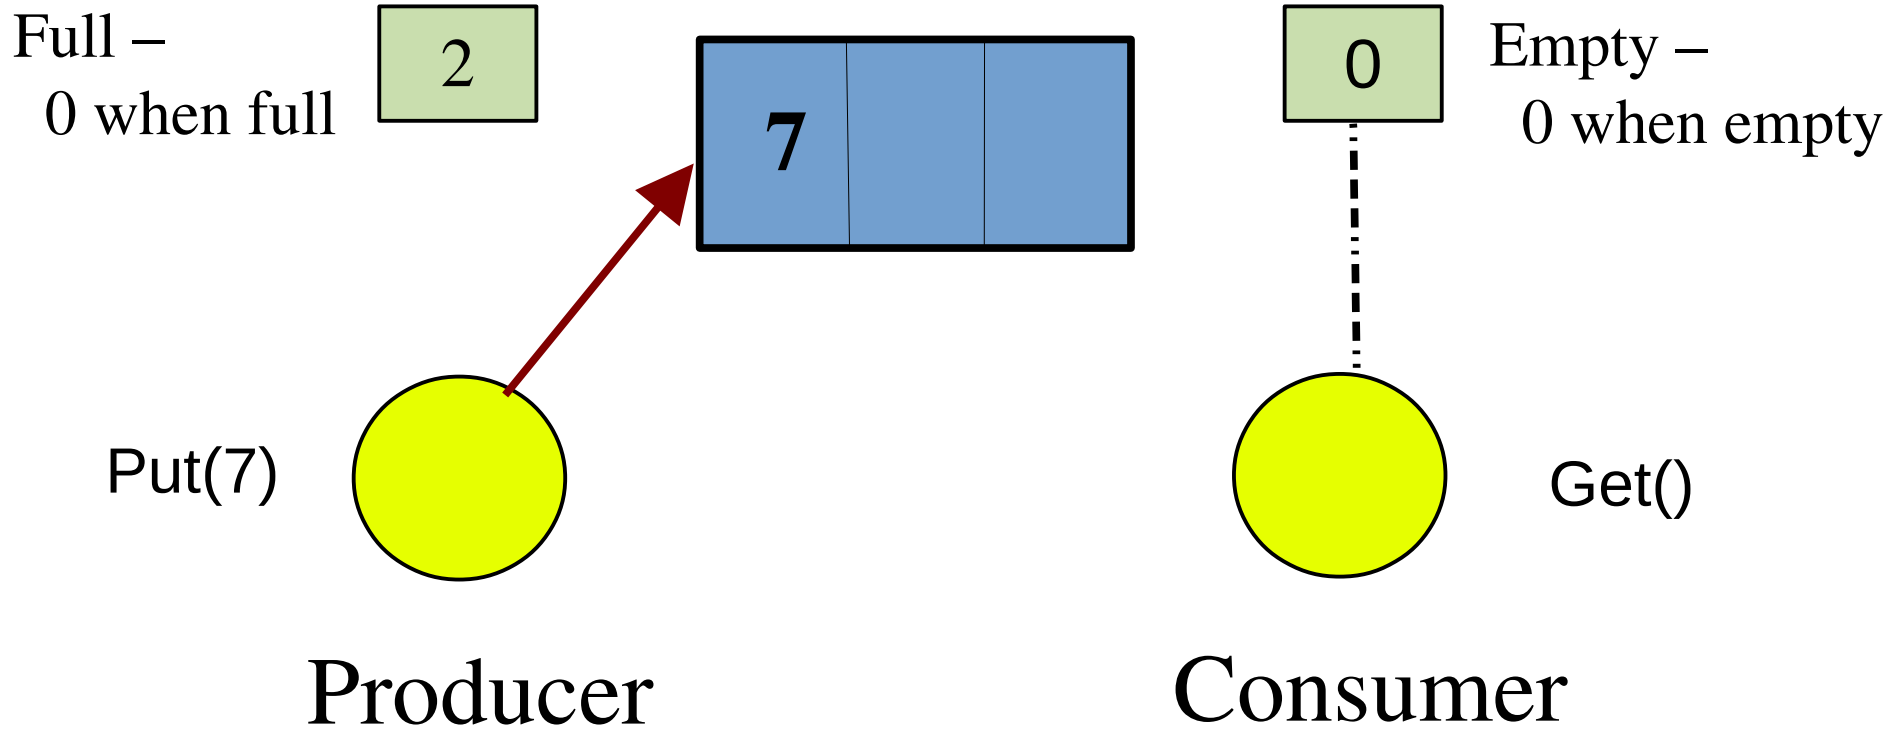

Monitor buffer is empty

The Empty semaphore's count is checked but is 0, consumer blocked!

The Full semaphore's count is checked to be  $> 0$

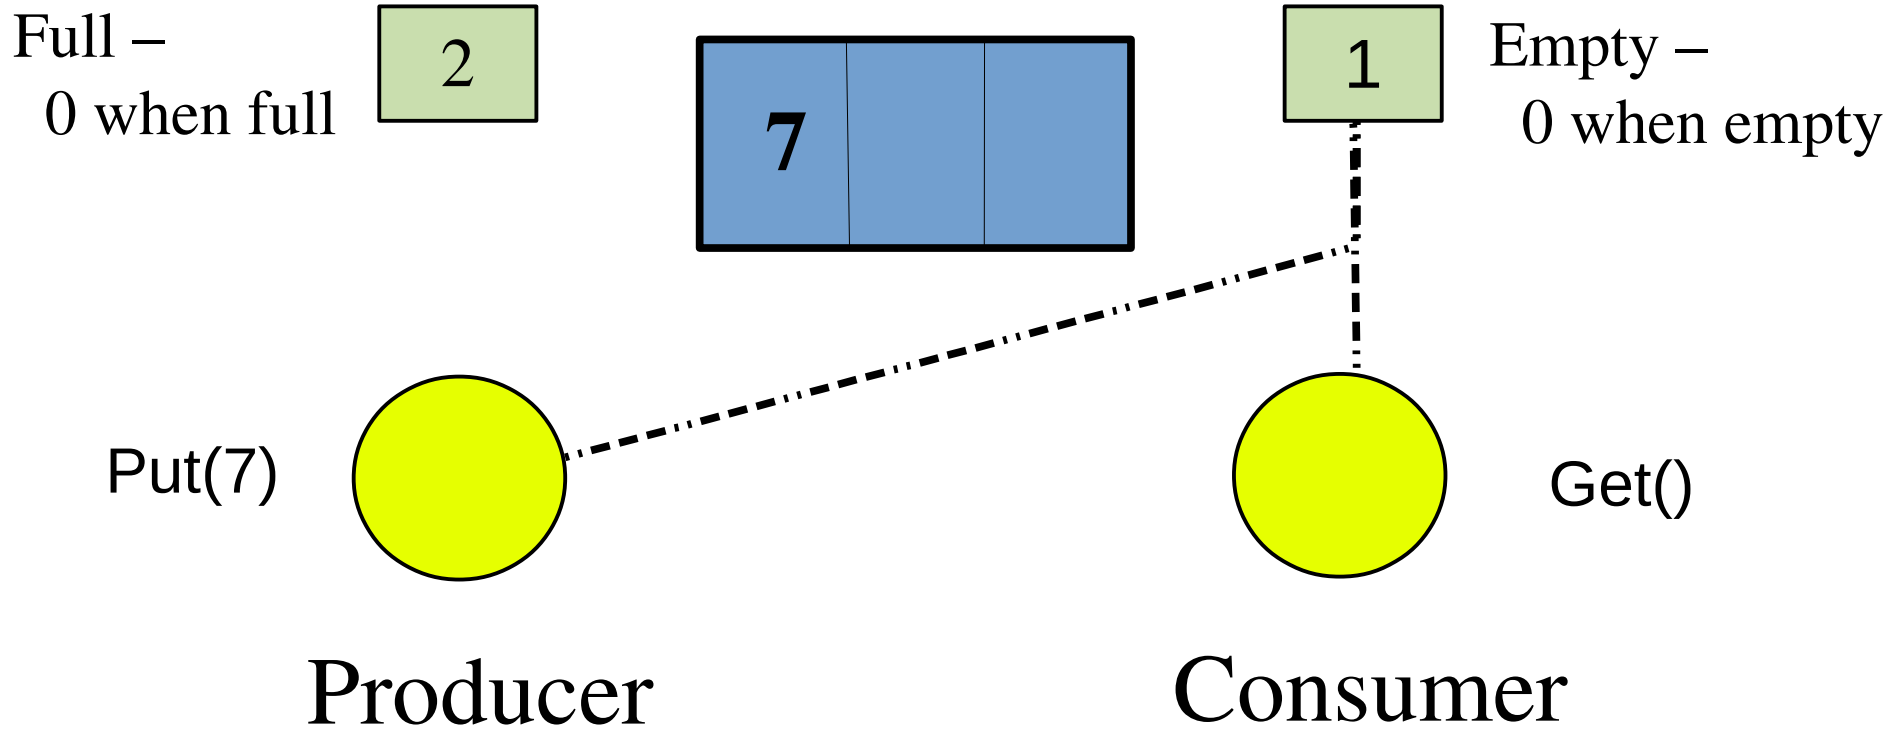

It is! So producer passes through and decrements Full's count

# Monitor

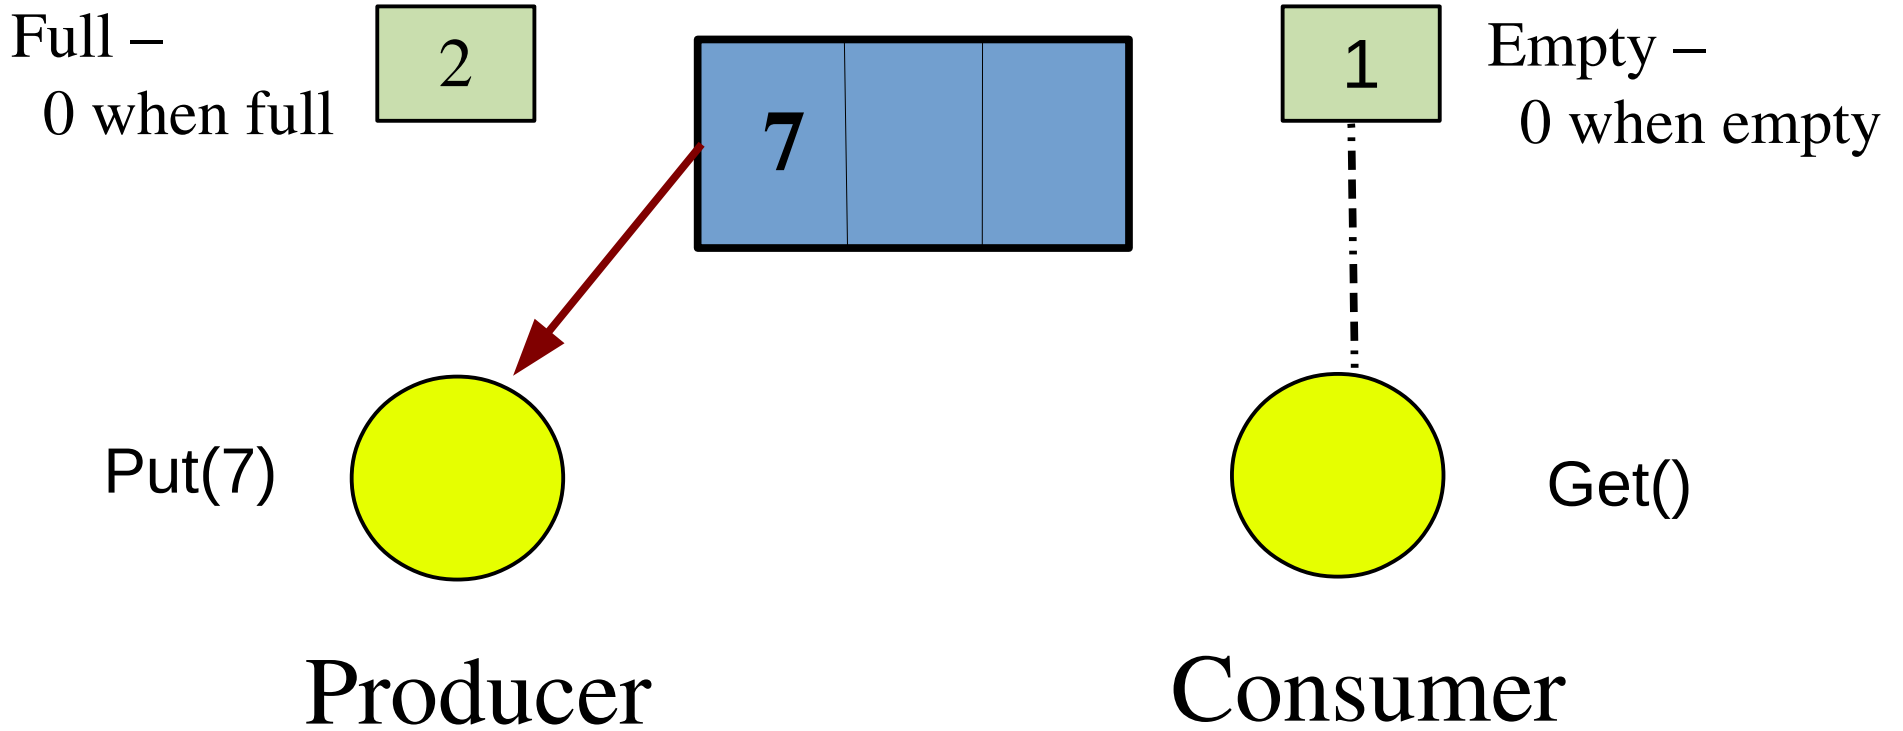

Monitor now has two vacant slots and one slot with 7  
Empty semaphore's count is checked but is 0, consumer is blocked  
Producer sends 7 to the Monitor's buffer

# Monitor

Monitor now has two vacant slots, one slot with 7  
The Empty semaphore's count is incremented

# Monitor

Monitor now has two vacant slots, one slot with 7  
Producer returns from put

# Monitor

Full –  
0 when full

2

1

Empty –  
0 when empty

Producer

Get()

Consumer

Monitor now has two vacant slots, one slot with 7

# Monitor

Full –  
0 when full

2

0

Empty –  
0 when empty

Producer

Get()

Consumer

Monitor now has two vacant slots, one slot with 7

Consumer awakens, decrements the Empty semaphore's count

# Monitor

Full –  
0 when full

2

0

Empty –  
0 when empty

Producer

Get()

Consumer

Monitor now has one position with 7  
Consumer requests a token from the Monitor

# Monitor

Full –  
0 when full

2

0

Empty –  
0 when empty

Producer

Get()  
- will get 7

Consumer

Monitor is empty

Monitor removes 7 from buffer, holds onto it

# Monitor

Monitor is empty

Monitor removes 7 from buffer, holds onto it

The Full semaphore's count is incremented

# Monitor

Full –  
0 when full

3

0

Empty –  
0 when empty

7 is returned

Producer

Get()

Consumer

Monitor is empty

Monitor sends 7 to the consumer
